Could baseline establishment be counterproductive for emissions reduction? Insights from Vietnam’s building sector
This article provides insights into the role of institutions involved in climate governance working towards a future low-carbon society at the national level, within the global climate change governance architecture. Specifically, it contributes to understanding the fragmented governance of energy efficiency policy in developing countries by focussing on Vietnam’s building sector, identifying key institutions related to underlying discourses, national and international power relations, resource distribution and coalitions. It uses the case of baseline setting in developing Nationally Appropriate Mitigation Actions (NAMAs) to illustrate institutional dynamics, nationally and transnationally, as well as to question whether demands for baseline setting achieve the ideal trade-off between actual GHG emissions reduction and institutionalized demands for accountability. The analysis reveals that, in addition to domestic efforts and challenges, the international agenda greatly influences the energy efficiency policy arena. The article presents lessons to be learnt about policy processes from the specific Vietnamese case, reflecting on the role of international actors and discourses in it. Finally, it argues for the abolition of baselines in favour of adequate monitoring and evaluation, from the perspective that requirement for deviation from fictitious baselines is unproductive and only serves an international techno-managerial discourse.

Decision-support tools for climate change mitigation planning
This document describes three decision-support tools that can aid the process of planning climate change mitigation actions. The phrase ‘decision-support tools’ refers to science-based analytical procedures that facilitate the evaluation of planning options (individually or compared to alternative options) against a particular evaluation criterion or set of criteria. Most often decision-support tools are applied with the help of purpose-designed software packages and drawing on specialised databases. The evaluation criteria alluded to above define and characterise each decision-support tool. For example, in the case of life-cycle analysis, the evaluation criterion entails that the impacts of interest are examined across the entire life-cycle of the product under study, from extraction of raw materials, to product disposal. Effectively, then, the choice of decision-support tool directs the analysis towards a specific type of decision criterion.

The Adaptation Finance Gap Report
UNEP’s Adaptation Gap Report series focuses on Finance, Technology and Knowledge gaps in climate change adaptation. It compliments the Emissions Gap Report series, and explores the implications of failing to close the emissions gap.

The 2016 Adaptation Gap Report assesses the difference between the financial costs of adapting to climate change in developing countries and the amount of money actually available to meet these costs – a difference known as the “adaptation finance gap”. Like the 2014 report, the 2016 report focuses on developing countries, where adaptation capacity is often the lowest and needs the highest, and concentrates on the period up to 2050.

The report identifies trends and highlights challenges associated with measuring progress towards fulfilling the adaptation finance gap, while informing national and international efforts to advance adaptation. It analyses the ‘adaptation finance gap’ against the background of the provisions laid out in the Paris Agreement, and benefits from the insights included in the INDCs.

Assessing climate change mitigation technology interventions by international institutions
Accelerating the international use of climate mitigation technologies is key if efforts to curb climate change are to succeed, especially in developing countries, where weak domestic technological innovation systems constrain the uptake of climate change mitigation technologies. Several intergovernmental agencies have set up specific programmes to support the diffusion of climate mitigation technologies. Using a simplified technological innovationsystem-based framework, this paper aims to systematically review these programmes, with the dual aim of assessing their collective success in promoting technological innovation and identifying opportunities for the newly formed UNFCCC Technology Mechanism. We conclude that, while all programmes reviewed have promoted technology transfer, they have given limited attention to innovation capabilities with users, government and universities. Functions that could be further developed include knowledge development, legitimation and market formation. These could be focal areas for the UNFCCC Technology Mechanism. We recommend that, in future programmes, part of the funding is dedicated to programmes doing research and development as well as capability development.

The Adaptation Finance Gap Update - with insights from the INDCs

In 2014 the United Nations Environment Programme (UNEP) published its first global Adaptation Gap Report (AGR 2014) (UNEP, 2014), which put forward a preliminary framework for assessing adaptation gaps along with an initial assessment in three selected areas: finance, technology and knowledge. Further to the positive reception of this report, several countries requested UNEP to produce follow up reports focusing on specific adaptation gaps. In response to these requests, UNEP has commissioned a new report with a special focus on finance gaps and options to bridge them. The report will be published in the spring of 2016. This update is intended as an input to discussions at the 21st session of the Conference of the Parties (COP 21) to the United Nations Framework Convention on Climate Change (UNFCCC). It brings together key findings on adaptation costs and finance from AGR 2014 and preliminary findings from the 2016 assessment. Furthermore, it draws on insights concerning adaptation costs and related finance needs, as stated in the adaptation components in the Intended Nationally Determined Contributions (INDCs) – the post-2020 climate actions that countries intend to undertake following a new global agreement on climate change.

The Multiple Benefits of Measures to Improve Energy Efficiency: A Summary Report

Understanding the barriers to, and enablers for, energy efficiency requires targeted information and analysis. This report is a summary of four detailed studies providing new insights on how to promote efficiency in selected priority areas. It complements initiatives such as the so-called energy efficiency accelerators, which seek to increase the uptake of selected technologies, as well as the work of many other institutions committed to improving energy efficiency. The modelling estimates and the case studies presented in this report illustrate that, while significant progress has already been achieved, the case for accelerating energy efficiency action is strong. Key highlights include:

• At the global level, energy efficiency improvements would account for between 2.6 and 3.3 Gt CO2e of the reductions in 2030, equivalent to between 23 and 26 percent of the overall reductions achieved in a scenario where the price of carbon dioxide equivalents was USD 70 per tonne.
• In absolute terms, the energy supply and industry sectors show the highest reductions in greenhouse gas emissions attributable to energy efficiency. In relative terms, it is the transport sector that shows the highest levels of emission reductions.
• The three mitigation scenarios considered suggest that the higher the carbon price, the greater the energy savings, and the larger the economic growth and employment benefits.
• While G20 countries account for about 90 percent of total emission reductions in the three mitigation scenarios, all countries can gain considerable benefits from improving the way they transform, distribute and use energy. Survey results from the case studies in this report highlight the types of benefits that energy efficiency programmes can deliver, from mitigation of greenhouse gas emissions and increased energy access, to reduced public sector spending and improvements in human health and well-being, among others.

Uncertainty in greenhouse-gas emission scenario projections: Experiences from Mexico and South Africa

This report outlines approaches to quantify the uncertainty associated with national greenhouse-gas emission scenario projections. It does so by describing practical applications of those approaches in the two countries – Mexico and South Africa. The goal of the report is to promote uncertainty quantification, because quantifying uncertainty has the potential to foster more robust climate-change mitigation plans. To this end the report also summarises the rationale for quantifying uncertainty in greenhouse-gas emission scenario projections.
Advancing methodological thinking and practice for development-compatible climate policy planning

There are growing calls for identifying climate mitigation and adaptation policy packages that would also support human development objectives at the national and regional levels. The literature on climate policy analysis and impact assessment continues to be driven by standard economics with its body of competitive general equilibrium optimization models and cost-benefit analysis techniques of aggregation and monetization. However, its recommendations for climate action are often based on highly restrictive underlying assumptions, which have been increasingly criticized for being too prescriptive, not adequately capturing salient observed socioeconomic realities, and not acknowledging pluralism in values. The main aim of this paper is to put forward a new methodological approach that seeks to address these deficiencies. A generic but comprehensive framework eliciting mitigation-adaptation-development interactions, accounting for institutional barriers, and drawing on a combination of an emerging body of new climate economics and multi-criteria decision analysis is suggested. We purport that, by using this framework, multi-dimensional impacts and multistakeholder interests could be better represented when planning climate policy actions. We also argue that analytical tools drawing on economic thinking which embraces interdisciplinary analysis and deep uncertainty and avoids the fallacy of unique optimal solutions, may deliver more effective strategies for pushing economies onto the transformational pathways required.
The Adaptation Gap Report - a Preliminary Assessment

This first Adaptation Gap report provides an equally sobering assessment of the gap between adaptation needs and reality, based on preliminary thinking on how baselines, future goals or targets, and gaps between them might be defined for climate change adaptation. The report focuses on gaps in developing countries in three important areas: finance, technology and knowledge.

This fifth Emissions Gap report has a different focus from previous years. While it updates the 2020 emissions gap analysis, it gives particular attention to the implications of the global carbon dioxide emissions budget for staying within the 2 °C limit beyond 2020. It does so because countries are giving increasing attention to where they need to be in 2025, 2030 and beyond. Furthermore, this year’s update of the report benefits from the findings on the emissions budget from the latest series of Intergovernmental Panel on Climate Change (IPCC) reports.

Assessing the effectiveness of policies to support renewable energy

Close to 80% of the world’s energy supply could be generated through renewables by mid-century with the right enabling public policies. Policies can play a fundamental role in promoting a sustainable energy-mix and it is key to measure their effectiveness in the medium and long run. What is the most effective way to measure and monitor this effectiveness? What can we learn from Brazil, one of the first emerging countries to refocus its national energy strategies toward renewable energy? And from South Africa, which committed to develop 42% of additional capacity in renewable by 2030? These are some of the questions addressed in the report commissioned by UNEP DTIE: Assessing the effectiveness of policies to support renewable energy.

The report demonstrates the importance of monitoring policy effectiveness by using the Policy Effectiveness Indicator (PEI) approach. While there is no one-size-fits all approach to designing renewable policies, a number of principles of policy design exist, which can dramatically increase the effectiveness and efficiency of renewable energy policies. Some recommendations for policy-makers include:

- assessing which of the three factors is holding back deployment,
- making sure that all three factors are robust for a high PEI score to be registered,
- implementing a detailed monitoring and reporting for all of the different aspects of renewable policy, and
- considering the entire policy framework into which incentives schemes are inserted.

MCA4climate - a practical framework for pro-development climate policy
Climate is an inordinate challenge but also an inordinate opportunity to transform economies onto a low-carbon, resource efficient Green Economy path. Catalyzing clean energy will not only cut greenhouse-gas emissions as part of eforts to limit a global temperature rise to under 2 degrees C or more, it also represents a way of curbing healthhazardous air pollution while oering a rapid path to address energy poverty, especially in rural areas of developing economies. Meanwhile enhancing ecosystems such as forests, mangroves and seagrasses in order to conserve their carbon stocks can also trigger multiple benefits from boosting water supplies and improving agriculture to maintaining natural sea defences and nurseries for fish. The 17th Conference of the Parties meeting in Durban, South Africa, later this year presents the world with another opportunity to advance the climate agenda and co-operative action under the UN Climate Convention. It is crucial that those actions are designed within a coherent and robust policy-planning framework to ensure that they are both cost-eective and compatible with broader social, economic and environmental goals. For developing countries, sound climatepolicy planning will also enhance access to climate finance from the developed ones. Climate-policy planning is a complex undertaking. Many developing countries are only just starting to consider how to go about it and some require improved access to the requisite knowledge, expertise and technical skills. Drawing upon best practices, tried and tested in other parts of the world, is clearly an advantage. The MCA4climate, a new UNEP initiative, is designed to assist policymakers, particularly in the developing world, in that endeavour. It oers concrete guidance and recommendations on a number of critical issues and proposes a formal framework for evaluating climate mitigation and adaptation policies, paving a practical way forward so that countries evolve sustainably and grow their economies in a way that keeps humanity’s footprint within planetary boundaries. It draws on the work of leading experts on climate policymaking from around the world and uses an innovative approach to assessing policies that ensures that climate policies and strategies take full account of developmental concerns and objectives. The MCA4Climate initiative reflects UNEP’s mission to provide leadership and encourage partnership in caring for the environment by inspiring, informing and enabling nations and peoples to improve their quality of life without compromising that of future generations—issues at the centre of Rio+20 next year in Brazil as governments look to scale-up and accelerate the implementation of the agreements, including those relating to climate change, established in Rio in 1992.

Solar Atlas for the Mediterranean

The solar resource is the "fuel" of solar energy applications and its availability is a key economic parameter in system design. Even though the southern and eastern Mediterranean region is served by several commercial data providers, in a public domain, so far only coarse resolution (100 km) data or data with limited temporal coverage is available. For more rapid development of policies and to attract the industrial interest in this region a more enhanced and easy to access free information is needed. The project will bring high resolution (1 km), long term coverage of at least 15 years data on the available solar resources for the region covering the countries Syria, Jordan, Israel, Lebanon, Egypt, Libya, Tunisia, Algeria, Morocco, Palestine National Authority, Mauretania and Turkey. The resource data will be derived from Earth Observation satellite data, based on published and transparent methodologies and the data will be validated with existing ground measurements in the region. The database will be provided by SOLEMI and Helioclim (SoDa) sources - Global Horizontal Irradiation (GHI) and Direct Normal Irradiation (DNI). The data will be made available via a distributed information system which will ensure the ease access to the data. The free access to the data will include historical annual and monthly averages, and more detailed data products and services will remain the domain of commercial data providers. This paper will show the first prototype of the user interface for an easy web access to the solar radiation as well as ancillary geographical data. With the presentation of this paper we aim to encourage potential users to give us feedback on the further development.

The Adaptation Finance Gap Report
The 2016 Adaptation Gap Report assesses the difference between the financial costs of adapting to climate change in developing countries and the amount of money actually available to meet these costs – a difference known as the "adaptation finance gap". Like the 2014 report, the 2016 report focuses on developing countries, where adaptation capacity is often the lowest and needs the highest, and concentrates on the period up to 2050.

Managing the risks associated with climate change in the oil and gas industry in Colombia

The project, funded by CIDA through OLADE, seeks to estimate climate change-related hazards, exposure and vulnerability for the oil and gas industry in Colombia. It gives high-resolution probabilistic estimates of precipitation, temperature (maximum and minimum) and wind speed, and combines them with semi-quantitative information about industry, socio-economic and geographic parameters, to estimate climate change-related risks for the industry.

The multiple benefits of measures to improve energy efficiency

The study provides world and G20 national- and sector-specific estimates of the emissions reduction potential associated with energy efficiency measures. To this end it relies on two world-class energy-economy models, thus quantifying the uncertainty associated with the estimates.

Model outputs are used in an econometric model, to assess the macro-economic impacts of measures aimed at improving energy efficiency. Assessed impacts include GDP growth, employment and trade balances, among others. For each country, national aggregates and sector specific figures (each with its uncertainty range) are provided.

The project further includes a survey of national policies in key sectors relevant to energy efficiency, such as iron and steel industry or household appliances, among others. For each sector three-to-five national cases are provided, each outlining measures that have proven effective in improving energy efficiency in that sector. These descriptions contain semi-quantitative assessments of the multiple benefits associated with improving energy efficiency (for example, impacts on human health, public budgets or environmental conditions).

UNEP Adaptation Gap Report

The Adaptation Gap Report by the United Nations Environment Programme outlines a generic framework for tracking progress towards adaptation objectives and elaborates on the framework (by providing specific definitions and other practical guidance) for three sectors - finance, technology and knowledge.

European Cooperation in Science and Technology 'action' to strengthen a European network of researchers in structured expert judgement (External organisation)
Period: 1 Jul 2013 → 30 Jun 2016
Daniel Puig (Member)
Department of Management Engineering
UNEP Risø Centre

Description
ISCH COST Action IS1304.

I act as the representative of Denmark in the Management Committee of the European Union's ISCH COST Action IS1304, which seeks to improve the use of structured expert judgement for decision making. I contribute to the work of two of the five working groups - one looking at how structured expert judgement compares to other techniques, notably Bayesian probabilistic projections, and a second one focused on documenting examples of practical application of structured expert judgement.

Body type: Inter-governmental
Degree of recognition: International
