Possibilities and barriers for e-learning in primary school in Denmark
How much are we using e-learning in primary school in Denmark? What are the barriers? What are the benefits? Why do we not use e-learning even more? These questions have been the focus for a one year national investigation conducted by ATV, The Danish Academy of Technical Sciences. The investigation included interviews with Danish researchers, persons from the ministry, teachers, students, and e-learning companies. The overall purpose was to make recommendations on how to accelerate the digital transformation of the Danish primary and high schools education system. In this paper, we combine some of the preliminary findings from the interviews with answers to a small questionnaire sent out to 19 Danish e-learning companies. We also add our own observations and visions for how e-learning could be used and which potentials we see for the near future. One major observation is that generally the attitudes to e-learning is positive: Denmark has political goals about access to machines, infrastructure, and internet at every school. There is dedicated substantial funding for schools buying e-learning material, and local successful e-learning companies such as Area9, EduLab, and Clio Online with international footprint and covering 90% of all schools in Denmark. Despite the many positive factors, which contribute to accelerating the use of e-learning, we also found others, which slow down the transformation: Lack of evidence of the benefits from e-learning tools, doubt about whether it is possible to gather evidence in learning, and higher demands for evidence for e-learning tools than for other educational tools. There is also a missing trust and missing communication among stakeholders. We also observed a lack of vision on how digitalization can go beyond “PDFing” a book, and, finally, we met a fear that using Big Data for personalization of the
teaching/learning process will be used to stereotype education, or will only be used to save costs

Fremtidens samfund mangler kvindelige professorer

Kvindekvoter er ligebehandling
Uden specielle tiltag for kvinder får mændene de største fordele.
Individualized Learning Through Non-Linear use of Learning Objects: With Examples From Math and Stat

Our aim is to ensure individualized learning that is fun, inspiring and innovative. We believe that when you enjoy, your brain will open up and learning will be easier and more effective. The methods use a non-linear learning environment based on self-contained learning objects which are pieced together by a Hyperbolic Graph, or by the students themselves. This learning system makes it easy for students to find a path through the course material which suits his/her personal learning style and which makes learning more motivating, and efficient, and which leads to better learning. The methods have been tested in two case studies. One was a continuing education course in statistics for a global medical company, and the other was a "big" - both in terms of the number of students and in the number of ECTS points - introductory course in mathematics at a major technical university. The continuing education course made it possible for the company’s employees, from many different parts of the company and from all around the world, to learn from the same course. For the university course we started with a pilot project where our methods were used during only one course week. The pilot was a success and we then used the experiences from it to reshape the entire course. This course has now been running for 5 years and consistently receives very good evaluations, both from students and teachers. A clear finding from the test cases is that our learning method creates more motivation and makes the students use more time on the course and prepare better for the lectures. An important discussing point is how much “free choice” is best for the learners. We believe that the possibility to follow your own learning style by choosing between different types of material is important and ensures better learning and more motivation for all students, and that for the best students it also gives courage to go beyond the curriculum.

Constraints on reusability of learning objects: Didactic aspects of modular e-Learning in engineering education

It is the aim of this paper to discuss some didactic constraints on the use and reuse of digital modular learning objects. Engineering education is used as the specific context of use with examples from courses in introductory electronics and mathematics. Digital multimedia and modular learning objects have been proclaimed as important elements in e-learning for a long time, and there are good reasons to believe in the benefits of interactive multimedia as well as flexible and modular learning objects. Nevertheless the use and reuse of learning objects on a large scale seems to be a slow success. Constraints on reuse arise from the nature of conceptual understanding in higher education and the functionality of learning objects within present technologies. We will need didactic as well as technical perspectives on learning objects in designing for understanding.

Why did the breast cancer lymph node status distribution improve in Denmark in the pre-mammography screening period of 1978-1994?

Background. Danish breast cancer patients diagnosed in 1978-1994 experienced a trend over time towards a more favourable distribution of lymph node status at time of diagnosis, which was not due to mammography screening. We investigated how this trend could be explained by patient characteristics at diagnosis: age (biological processes), calendar period (e.g. environmental changes), birth cohort (living conditions over a life time), post-menopausal status (a predictor of less favourable nodal status), and tumour diameter (a marker of detection time). Material and methods. The data set consisted of 22 955 patients aged 30-69 years at time of diagnosis with known lymph node status, known tumour diameter, known menopausal status, and clinically detected tumours, available from the Danish Breast Cancer Cooperative Group (DBCG). Age, period, cohort, menopausal status, and tumour diameter were used as predictors in generalised linear models with either node-positive status (at least one of the excised lymph nodes being tumour-positive) or severely node-positive status (at least half of the excised lymph nodes being tumour-positive) as outcomes. Lymph node status was assessed both empirically and estimated using an EM algorithm in order to reduce misclassification. Results and discussion. We found that the improved lymph node status distribution was most likely a period effect due to a combination of earlier detection of clinical tumours, explaining most of the trend in node-positive breast cancer and half of the trend in severely node-positive breast cancer, and some unknown factor affecting lymph node status but not necessarily other tumour characteristics.

Statmaster and HEROS - web-based courses first and second generation

With the increasing focus on life-long learning, and with the convenience and accessibility of the Internet, the market for web-based courses has expanded vastly in recent times—in particular in connection with continuing education. However, teaching web-based courses presents various technical as well as pedagogical challenges. Some of these challenges are addressed, and means to dealing with them are suggested. A second generation of web-based courses is comprised of
learning objects, which allows for tailoring courses for specialized groups of students, and accommodate individualized learning. The concept of learning objects and how they are used to form new courses are discussed.

Learning Statistics - in a WEB-based and non-linear way

Have you thought about why most teaching is linear? Do you know what non-linear learning means? Do you use web-based learning? And have you ever thought of combining web-based learning with “standard” university teaching such as lectures, problem based learning etc.? Students nowadays are very different from one another. They have different prior knowledge and different learning styles so it is a challenging task to teach them all in the same way. Furthermore the world of statistics has become so huge that it is impossible to cover everything. The structure imposed by the Bologna agreement gives a greater mobility which is good for both the students and the universities but leads to even more “inhomogeneity” at the courses. One possible solution is to combine traditional university teaching with web-based learning organized by using learning objects in a non-linear way. This means that the students can design the course – or a part of the course – so that it fits their individual learning style and their prior knowledge. Some prefer to look at examples first and afterwards look at which theories it is based on. Others want to do it the opposite way. Some want to work with the problem themselves at first, then look at some pictures which show the essential parts and then read a text or listen to a spoken explanation. There are many possibilities – only your fantasy limits you. Learning objects are easy to modify (in contrast to writing a new book) and it is easy to use learning objects made by others and in this way make the job as a teacher both easier and more fun.

Of course the non-linear way of organizing learning objects can also be used in stand-alone web-based courses and in many other contexts as e.g. in school education and continuing education.

Stochastic modelling of dissolved inorganic nitrogen in space and time

Environmental monitoring datasets often contain a large amount of missing values, and are characterized as being sampled over time on a distinct number of locations in the area of interest. This paper proposes a stochastic approach for modelling such data in space and time, by taking the spatial and temporal correlations in data into account. It has been applied to observations of dissolved inorganic nitrogen in the Kattegat during the period 1993-1997. Modelling results are shown as maps of the spatial distribution of dissolved inorganic nitrogen (DIN) in 4 weeks, representing the four seasons, and as time series of DIN at three different locations. However, the model approach could be applied to any space-time point given by a location in the Kattegat area and a week in the 5-year period 1993-1997. The results can be interpreted from a biological and physical point of view. Thus for the specific application the approach seems to perform very well. The results obtained could be used to improve status reporting of the environment, or as forcing functions for time series models and deterministic, hydrodynamic ecosystem models.

Correlation of Cadmium Distribution Coefficients to Soil Characteristics

Cadmium (Cd) distribution between the soil solid phase and the soil solution is a key issue in assessing the environmental effect of Cd in the terrestrial environmental. Previous studies have shown that many individual minerals and other components found in soils can bind Cd, but most studies on whole soil samples have shown that pH is the main parameter controlling the distribution. To identify further the components that are important for Cd binding in soil we measured Cd distribution coefficients (K-d) at two fixed pH values and at low Cd loadings for 49 soils sampled in Denmark. The Kd values for Cd ranged from 5 to 3000 L kg(-1). The soils were described pedologically and characterized in detail (22 parameters) including determination of contents of the various minerals in the clay fraction. Correlating parameters were grouped and step-wise regression analysis revealed that the organic carbon content was a significant variable at both pH values. Cation exchange capacity (CEC) and gibbsite were important at the low pH (5.3) while iron oxides also were important at the high pH (6.7). None of the other clay minerals present in the soils (illite, smectite, kaolinite, hydroxy interlayered clay minerals [HIM], chlorite, quartz, microcline, plagioclase) were significant in explaining the Cd distribution coefficient.

Methods for estimating the semivariogram
Modelling spatial variability, typically in terms of the semivariogram, is of great interest when the objective is to compute spatial predictions of parameters measured in space. Such parameters could be rainfall, temperature or concentrations of polluting agents in aquatic environments. In the existing literature various methods for modelling the semivariogram have been proposed, while only a few studies have been made on comparing different approaches. In this paper we compare eight approaches for modelling the semivariogram, i.e. six approaches based on least squares estimation of an experimental semivariogram, as well as maximum likelihood and restricted maximum likelihood estimation. The comparison is made by simulating spatial data with a known covariance structure, and comparing the "true" parameters with those computed. The comparison showed that maximum likelihood and restricted maximum likelihood performed better than the least squares approaches. We also applied maximum likelihood and least squares estimation to a real dataset, containing measurements of salinity at 71 sampling stations in the Kattegat basin. This showed that the calculation of spatial predictions is insensitive to the choice of estimation method, but also that the uncertainties of predictions were reduced when applying maximum likelihood.
A Modified Nottingham Prognostic Index for Breast Cancer Patients Diagnosed in Denmark 1978-1994

Stage of disease is a predictor of breast cancer survival. We used data from the Danish Cancer Register and the Danish Breast Cancer Cooperative Group to study stage distribution in 0-69-years-old Danish breast cancer patients diagnosed in 1978-1994. We constructed a modified Nottingham Prognostic Index (NPI) calculated from the number of excised and positive lymph nodes, malignancy grade and tumor diameter. This NPI could be calculated for 63% of the patients, and among these the stage distribution improved during the study period. The proportion of patients with a poor prognostic score decreased from 27% to 20%. Based on a comparison of the crude 3-year survival of patients with an NPI score and those without, it seems probable that the stage of disease at diagnosis on average improved in Danish breast cancer patients below age 70 during the 1980s and the early 1990s.

Lateral gas transport in soil adjacent to an old landfill: factors governing emissions and methane oxidation
Field investigations of lateral gas transport and subsequent emissions in soil adjacent to an old landfill in Denmark have been conducted during a one-year period. A significant seasonal variation in the emissions with high carbon dioxide and low methane fluxes in the summer (May to October) was observed. This was attributed to methane oxidation. Diurnal measurements during a drop in barometric pressure showed that the fluxes of landfill gas changed dramatically within a very short time. The concentrations and the soil moisture content in the upper part of the soil profile had significant influence on the fluxes, as did the distance from the landfill border, temperature, barometric pressure and the pressure gradient. Statistical analyses proved that soil moisture described the largest part of the variation. No methane at all emitted during the summer. Calculations and isotope analyses showed that very high fractions of the laterally migrating methane were oxidised.

Correlating phospholipid fatty acids (PLFA) in a landfill leachate polluted aquifer with biogeochemical factors by multivariate statistical methods

Different multivariate statistical analyses were applied to phospholipid fatty acids representing the biomass composition and to different biogeochemical parameters measured in 37 samples from a landfill contaminated aquifer at Grindsted Landfill (Denmark). Principal component analysis and correspondence analysis were used to identify groups of samples showing similar patterns with respect to biogeochemical variables and phospholipid fatty acid composition. The principal component analysis revealed that for the biogeochemical parameters the first principal component was linked to the pollution effect and to redox processes and the second principal component described the geological and geochemical features of the samples. Dependent on the data transformation of the phospholipid fatty acid profiles in either absolute concentrations (logarithm transformed) or in mol% of total phospholipid fatty acids, different groups of samples and outliers were revealed by the principal component analysis. The principal component analysis on data in absolute concentrations revealed that many phospholipid fatty acids reflected the pollution effect on the biomass composition. In contrast, the phospholipid fatty acids in mol% divided the samples into one group of the more polluted samples and another with the nearly unpolluted samples. The important phospholipid fatty acids for this grouping were mainly a few of the normal saturated phospholipid fatty acids (10:0, 16:0 and 18:0). Discriminant analysis was used to allocate samples of...
phospholipid fatty acids into predefined classes. A large percentages of samples were classified correctly when discriminating samples into groups of dissolved organic carbon and specific conductivity, indicating that the biomass is highly influenced by the pollution. In contrast, the discriminant analysis revealed that on the basis of the profiles of phospholipid fatty acids no good discrimination between samples showing dominant sulfate reduction and dominant iron reduction could be made, nor between samples showing dominant nitrate reduction and aerobic respiration. Partial least square analysis related the phospholipid fatty acids data to the biogeochemical parameters assuming linear relationships. After selection of the optimal phospholipid fatty acid combination by genetic algorithms, good partial least squares models with low prediction errors were gained primarily between the biogeochemical parameters describing total contents of carbon, pH and chloride. The models predicting specific activity in terms of, e.g., sulfate reduction activity in a sample had relatively higher prediction errors and low correlation coefficients. This indicates that the phospholipid fatty acid profiles from complex habitats have limited value for identifying more specific microbial populations.

Comparison of Soxhlet and Shake Extraction of Polycyclic Aromatic Hydrocarbons from Coal Tar Polluted Soils Sampled in the Field

This study compares three extraction methods for PAHs in coal tar polluted soil: 3-times repeated shaking of the soil with dichloromethane-methanol (1:1), Soxhlet extraction with dichloromethane, and Soxhlet extraction with dichloromethane followed by Soxhlet extraction with methanol. The extraction efficiencies were determined for ten selected PAHs in triplicate samples of six soils sampled at former gasworks sites. The samples covered a wide range of PAH concentrations, from 0.6 to 397 mg/kg soil. Soxhlet extraction with dichloromethane followed by Soxhlet extraction with methanol, in general, was the most efficient method yielding 30 to 50 % higher concentrations than the other methods.

Comparison of different calibration methods suited for calibration problems with many variables

This paper describes and compares different kinds of statistical methods proposed in the literature as suited for solving calibration problems with many variables. These are: principal component regression, partial least-squares, and ridge regression. The statistical techniques themselves do not provide robust results in the spirit of calibration equations which can last for long periods. A way of obtaining this property is by smoothing and differentiating the data. These techniques are considered, and it is shown how they fit into the treated description.
Modelling the growth of methane-oxidizing bacteria in a fixed biofilm

Methane-oxidizing bacteria were grown in a fixed biofilm reactor in order to study their ability to degrade chlorinated aliphatic hydrocarbons. Focus is on the growth behaviour of the mixed culture. The growth is described by a model that includes methanotrophic bacteria in the active biomass fraction. The inactive biomass fraction consists of exocellular polymers and biodegradable and inert particulate biomass. The model describes the oxygen respiration in detail. Yield coefficients, decay constants and hydrolysis constants are estimated based on the oxygen respiration. An analysis of the observability of the system reveals that several of the coefficients cannot be determined explicitly due to the complexity of the model and the limited amount of variables measured. Estimation procedures based on least squares methods are employed and parameter estimates and confidence intervals are computed. The study forms the basis for setting up a future measuring programme. This work indicates a yield coefficient for methanotrophs of 0.36 mg biomass COD per mg CH₄. In weight units this corresponds to approx. 1.44 mg biomass per mg CH₄. This is close to the theoretical maximum growth yield for methanotrophs.

HEROS in mathematics - a new way of learning

Department of Mathematics
**E-learning project HEROS for first year math - new ways of learning**

The aim of this project is to develop a new web based learning platform for the course Engineering Mathematics 1 – a platform which combines cutting edge e-learning materials and strategies with lectures, textbooks, weekly menus, and Maple demos. The main task is to further support the multifaceted architecture of the course while still keeping it clear cut and transparent. The idea is to make room within this architecture for several interlinked teaching styles and teaching materials and thus enhance the possibility for the individual student to find and operate his or her own most effective learning style. New “nonlinear” learning objects including text files, animations, video clips etc. will be developed and packed in order to create multiple entries into the process of understanding the key mathematical concepts.

Continuing education voucher systems: A flexible and targeted statistics programme based on learning objects and blended learning

Learning should be fun as well as inspiring and innovative. What you learn should be directly applicable to your daily work and should help you see things in a new perspective, and your studies should fit into a busy life. Who of us has not tried to return home from a course, putting the briefcase away and shelving the hand-outs, only to forget the knowledge acquired during the excellent course because it was not really applicable to our daily work, and because there is not time during an ordinary working day to put acquired theories into practice. The world around us changes so fast that life-long learning is a prerequisite for possessing the competencies demanded by the business sector. Today, data analysis is used in practically all areas of society and plays an important role in almost any company. Many employees find it important to be familiar with data analysis and able to apply statistical methods – competencies that will increase the quality of their company and save it considerable expense. So we need a new type of continuing education that will reflect a rethinking of content, form and duration. In the future, continuing education will be in the form of voucher systems. You may attend the specific chunk of a study programme you require whenever it suits you and pay only for what you get. If continuing education is to be attractive to employees as well as companies, study programmes must meet the following requirements: •It should be possible to follow a programme in parallel with an ordinary job •It should be possible to work on study projects at your leisure. •Knowledge gained from a study programme should be directly applicable to your daily work. If the providers are to meet these requirements, the task of developing new study courses and tailor these to new students must be manageable. We have therefore proposed a new type of research-based continuing education courses. These courses are structured around ‘learning objects’, i.e. short complete education sessions, which may be combined in various ways according to the students’ interests and levels. We combine them with ‘blended learning’, i.e. a combination of e-learning, web-based learning and face-to-face learning.

Kvantitativ sammenligning af brystkræftmaterialet i Cancerregistret og DBCG’s database

Data fra Cancerregistret (CRG) og Danish Breast Cancer Groups (DBCGs) register anvendes hyppigt ved opgørelser og videnskabelige undersøgelser. Specielt anvendes data fra DBCGs registre ofte i kliniske og epidemiologiske undersøgelser, blandt andet fordi mange af de for prognosen interessante oplysninger kun er tilgængelige i DBCGs register, og fordi kvaliteten af data, all andet lige, bør være bedre i en klinisk database end i et epidemiologisk minimumsregister. Det er således af interesse at undersøge kompletheden såvel af CRG som af DBCGs register. The aim of the study is to compare the breast cancer patient material in the Danish Cancer Registry and the DBCG clinical database. The purpose of the Danish Cancer Registry and the DBCG clinical database is quite different. Therefore it is not surprising that the main part of the differences can be accounted for by systematical conditions.

Bladder tumors
Dansk Urologisk Selskab har nedsat en arbejdsgruppe, der skal planlægge en landsdækkende registrering af patienter med blæretumor i Danmark med henblik på at forbedre, standardisere og rationalisere behandlingen af denne patientgruppe. Arbejdet tager udgangspunkt i det eksisterende BCR (Blære Cancer Registret), der kontinuerligt har akkumuleret data fra blæretumorpatienter gennem 10 år på Herlev og Skejby hospitaler.

Breast cancer incidence and mortality
In Denmark, as in all western countries, breast cancer mortality has remained relatively stable. The most obvious explanations for the empirically improved survival would be improved treatment or earlier diagnosis, possibly caused by screening. If earlier diagnosis was the most important explanation one would expect to see a small change in stage specific survival, but a large change in the stage distribution towards less advanced stages of the disease in the time of diagnosis, and vice versa if improved treatment was the most important explanation. Obviously it is important to be able to distinguish between these two explanations. In the project we focus on answering the following questions: How is the breast cancer stage distribution in Denmark 1978 - 94? Why has the stage distribution of breast cancers at time of diagnosis improved in Denmark 1978-94?

**Correlating phospholipid fatty acids (PLFA) in a landfill leachate polluted aquifer with biochemical factors by multivariate statistical methods.**
Different multivariate statistical analyses were applied to phospholipid fatty acids representing the biomass composition and to different biogeochemical parameters measured in 37 samples from a landfill contaminated aquifer at Grindsted Landfill (Denmark). Principal component analysis and correspondence analysis were used to identify groups of samples showing similar patterns with respect to biogeochemical variables and phospholipid fatty acid composition.

**Quality Improvement of Drug Therapy for Asthma Patients - Evaluation of a Co-operative Danish Programme**
Drug therapy is an essential in managing asthma. In spite of increased possibilities in asthma management (eg. peak-flow meters and patient diaries) and the existence of improved anti-asthmatic drugs, the morbidity and mortality of asthma have not improved in Denmark. The purpose of this Therapeutic Outcomes Monitoring project is to establish therapeutic outcomes monitoring as a continuous quality improvement activity for the medication use process among asthma patients in primary health care. To evaluate the experiment in pharmacy practice we use a combined evaluation strategy which is composed of (i) a controlled effect study, (ii) a process- and participant evaluation, (iii) a health economical analysis, and (iv) a qualitative ingerview study.

Anvendelse af stokastiske differentialligninger i biometri.
De klassiske modeller for biologisk nedbrydning af stoffer antager et forløb, der følger en eller flere sammenhørende differentialligninger med faste og tidsuafhængige koefficienter. I praksis ses imidlertid et forløb, der nok er kontinuerligt, men mere tilfældigt og desuden er overlænkt med maalestoej. Projektets formål er saaledes at beskrive de tilfældige variationer i nedbrydningsforløbet ved hjælp af stokastiske differentialligninger samt at identificere maalestoej.

Biologisk vækst i mulitkomponentsystemer.
Der betragtes mulitkomponentsystemer af organiske stoffer, hvor de enkelte stoffer kan nedbrydes af en eller flere grupper af mikroorganismer. Der skal saaledes opstilles en model der beskriver omsætningen af stoffer. Ligningsystemets strukturelle karakter antages at være kendt og problemet bestaar saaledes i at estimere de ukendte parametre, der indgår i differentialligningerne. Desuden behandles problemer vedr. observerbarhed. Konkret er formålet at bedre forståelsen af de grundlæggende biologiske og reaktionskinetiske forhold, der bestemmer omsætningen af mono aromatiske hydrocarboner (MAH) i grundvand, saaledes at der skabes basis for en biologisk baseret oprensningsteknik for MAH-forurenet grundvand.

Incidence of clubfoot in Frederiksborg County, Denmark.
The incidence of congenital clubfoot in Frederiksborg County, Denmark, was studied over a period of 16 years (1979-1994). Altogether 60,186 living infants were born, and of these 72 had a congenital clubfoot. Twenty-five children (35%) had bilateral clubfoot and 54 (75%) were boys. The overall incidence was 1.20 per thousand children. The incidence increased significantly during the observation period and was 2.41 per thousand in 1994. We cannot explain the rising incidence. The statistical analysis is made on the base of the theory for generalized linear models.

Statistical Treatment of Ecotoxicological Data based on Hazard Modelling
When characterising complex chemical pollution i.e. pesticide polluted groundwater or testing the effects of chemical compounds on the environment, ecotoxicological tests are of great value. This is due to their sensitivity and their expression of the overall toxicity. Since environmental pollution is increasing it is judged that ecotoxicological assays will have increasing impact on the toxicity- and risk assessment of environmental pollution. Evaluating results from ecotoxicological tests inevitably include estimation of dose-response relations. Conclusions about toxicity of the pollution or tested chemicals are summarised in characteristics extracted from the dose-response relationship. A revision of the statistical methods for extracting these measures has been internationally recommended by the scientific community. The dose/time-response models used are based on biological considerations, the key assumption is that the hazard rate is proportional to the concentration of the chemical compound in the animal as far as it exceeds the no-effect level. The uptake dynamics are described by a one compartment model involving the uptake rate and elimination rate. The dynamic models are compared with the traditional models, regarding the number of parameters, description of experimental data etc.

Statistical Treatment of Ecotoxicological Data with Continuous Response using biologically based models
When characterising complex chemical pollution i.e. pesticide polluted groundwater or testing the effects of chemical compounds on the environment, ecotoxicological tests are of great value. This is due to their sensitivity and their expression of the overall toxicity. Since environmental pollution is increasing it is judged that ecotoxicological assays will have increasing impact on the toxicity- and risk assessment of environmental pollution. Evaluating results from ecotoxicological tests inevitably include estimation of dose-response relations. Conclusions about toxicity of the pollution or tested chemicals are summarised in characteristics extracted from the dose-response relationship. A revision of the statistical methods for extracting these measures has been internationally recommended by the scientific community. Generalized Nonlinear regression methods using classical dose-response models, are used to estimate the variance heterogeneous dosis-response relations and estimate endpoints and their confidence limits.
Statistics in ecotoxicological guidelines
Project no. 1161, Grundvandscentret. Ph.D. project: Jens Strodl Andersen A revision of the guidelines for ecotoxicological tests has shown severe lack of statistical recommendations. It has been internationally recommended by the scientific community to enhance the use of statistics in the design and data treatment in most ecotoxicological tests. Helle Holst has participated in International workshops which have resulted in reports and articles describing the state of the art and the perspectives for the future. Research regarding design and modelling is ongoing.

Statistisk analyse af jordkomponenters betydning for cadmium sorption i jord.
Formaallet med projektet er at undersøge om distributionskoefficienten, der udtrykker forholdet mellem komponenten bundet i hhv. jord- og vandfasen kan beskrives ved hjælp af en række jordparametre samt hvilke jordparametre der i denne forbindelse er vigtige. Sekundaert er formaallet at optimere bestemmelsen af distributionskoefficienten ud fra sammenhørende værdier af S og C. Projektet udføres i samarbejde med IMT og KVL.
