Research outputs:

**Improving drivers’ hazard perception in pedestrian-related situations based on a short simulator-based intervention**

Young drivers remain over-represented in road accident statistics and hazard perception is a likely source of a skills gap between younger and older drivers. The aim of this study was to examine whether a short hazard perception training intervention in a driving simulator enhances young drivers’ tactical hazard perception skills in pedestrian-related situations. The intervention combined error and instructional commentary training. Thirty young drivers were trained and compared to 30 untrained drivers based on their eye fixations and driving behaviour in potential visible and hidden hazard situations. The results showed that trained drivers responded to one of three hazards by decreasing speed, while untrained drivers did not. Additionally, trained drivers had lower self-assessed hazard perception skills after than before the training, suggesting that exposure to these critical situations and the opportunity to negotiate them increased their awareness of the limitations of their driving skills. The eye fixation analysis showed that trained drivers fixated on the hidden hazard locations more often, indicating that they had greater awareness of the situation than untrained drivers. The training intervention showed a positive effect in improving drivers’ approach speed and fixations in hidden hazard situations, which requires more advanced hazard perception skills. This training intervention can be further developed into a training module as an addition to existing conventional training in the classroom and on the road.
Ulykkesanalyse vedrørende knallert 30, knallert 45 og lille motorcykel: Delnotat IV
I det følgende præsenteres resultatet af en kortlægning af ulykkesbilledet vedrørende knallert 30, knallert 45 og lille motorcykel. Formålet har dels været, at få et indblik i centrale karakteristika for de ulykker som de unge førere af de pågældende køretøjstyper er involveret i. Formålet har endvidere været at se, om ulykkesbilledet for de unge brugere af køretøjet adskiller sig fra ulykkesbilledet for de voksne brugere af køretøjet.

Adolescents’ associations between travel behaviour and environmental impact: A qualitative study based on the Norm-Activation Model
The negative environmental impact of car-dependent daily transport is well known. Young people of today are the potential drivers of the future and their mode choice will influence the environment for many years. This study explores the associations drawn between daily transport and environmental impact among 15-year-old Danish adolescents. We conducted 50 in-depth interviews and analysed them using a data-driven inductive thematic approach. We interpret differences in pro-environmental awareness and engagement on the background of the Norm-Activation Model (Schwartz, 1977). Based on their personal norm and the denial of consequences and responsibility of own behaviour, we identified five sub-groups of adolescents called Environmentalists, Pragmatics, Indifferent, De-emphasisers, and Deniers. Results indicate a need for measures to increase adolescents’ awareness and acceptance of daily transport as a relevant issue in relation to sustainability. Such measures should include tangible feedback in a daily context while taking different coping strategies with regard to climate change into account.
Ældre bilister bruger teknologi til at kompensere for fysiske vanskeligheder

Resultaterne fra en canadisk undersøgelse tyder på, at hjælpsystemer ikke spiller en afgørende rolle for ældres valg af bil ved bilkøb. Dog viser undersøgelsen, at de ældre efterfølgende kan blive glade for hjælpsystemerne i deres nye bil.

Ældre har glæde af at bruge GPS til at finde vej

Et hold forskere fra Canada har undersøgt, hvad ældre bilister synes om at anvende en GPS, når de kører bil, og hvordan brugen af GPS påvirker deres bilkørsel.

Aldersforskelle i evnen til at overtage kontrol fra en selvkørende bil

En ny undersøgelse har testet, om der er forskel på, hvilke aktiviteter henholdsvis unge og ældre foretager sig under kørsel i en selvkørende bil, og om der findes aldersforskelle i evnen til at overtage kontrollen fra den selvkørende bil.
Bicycle accidents in Denmark – the contribution of cyclist behavior, the vehicle and the road

Knowledge on accidents and factors contributing to their occurrence is of key importance for the development of targeted preventive efforts. High levels of underreporting is a well-known challenge particularly for bicycle accidents. Medical records from 4205 cyclists from 2010-2015 were included in this study. The sample included all cyclists registered at the emergency room due to a bicycle accident during the study period. The purpose of the study was to improve knowledge on factors contributing to cyclist accidents based on a qualitative identification of accident factors and underlying factors. When identifying accident factors, we made a distinction between factors related to the condition and behaviour of the cyclist, the road and its surrounding, the bicycle and the other party. We identified 3124 accident factors most of which regarded the other party or the behaviour and condition of the cyclist. However, we also identified damaged roads and poor maintenance of the bicycle as important factors contributing to the occurrence of the bicycle accidents.

Bilisters og cyklisters livskvalitet efter ulykke

En ny svensk undersøgelse har fundet, at bilister i større omfang end cyklister oplever et tab af livskvalitet efter en trafikulykke. Uanset om man var bilist eller cyklist under trafikulykken, var det skader på de nedre ekstremiteter, som førte til det største tab af livskvalitet.
Bilister tilpasser deres opmærksomhed til situationens krav
Reklamer langs landets veje kan potentielt skabe farlige situationer i trafikken, da bilister risikerer at blive distraheret af reklamerne. Ny forskning fra Australien har undersøgt, hvorvidt og hvordan reklamer langs vejene påvirker bilisters forståelse af trafiksituationen (situation awareness).

Consistency between subjectively and objectively measured hazard perception skills among young male drivers
Young male drivers have lower hazard perception skills (HPS) than older and more experienced drivers and a tendency to overestimate their skills in hazardous situations. Both factors contribute to an over-representation in traffic accidents. Based on a sample of 63 drivers aged 18-24, this study compares the consistency of HPS measured by objective and subjective measures and the link between these measures is the key contribution of the study. Both visible and hidden hazards are included. Objective measures of HPS include responsiveness and eye movements while driving in a driving simulator. Subjective measures of HPS include self-reports derived based on the Hazard Perception Questionnaire (HPQ), Driving Skill Questionnaire (DSQ), and Brief Sensation Seeking Scale (BSSS). Results show that drivers who respond to the hazards on time, as compared to drivers who do not respond, have higher scores on subjective measures of HPS and higher driving skills in the visible but not in the hidden condition. Eye movement analysis confirms the difference and shows that response in time to hazards indicate higher HPS and young drivers are poor at detecting hidden hazards. Drivers with a response in time locate the hazard faster, have more fixations, but dwell less on the hazard. At the same time, those who do not respond have a later first fixation and fewer but longer fixations on the hazard. High sensation seeking drivers respond to visible hazards on time, suggesting that sensation seeking does not affect HPS negatively when the hazard is visible. To enhance the HPS among young drivers, the results of this study suggest that specific hazard perception training is relevant, especially for hazards that require more advanced HPS.

Driver training in a simulator. Improved hazard perception.

This is an exhaustive report on the use of simulators in driver training in Denmark and a description of an effective hazard perception skill training procedure by the use of a simulator performed at the Technical University of Denmark (DTU) with financial support by TrygFonden. Improving road safety among young drivers is an efficient way to improve road safety due to the large over-representation of young drivers in road traffic accidents. Therefore, the development of new methods to improve driving skills among young drivers is highly relevant. Research shows that a lack of hazard perception skills (HPS) is a central element in the high risk among young drivers, and driving experience is a key factor for the acquisition of HPS. A driving simulator offers the possibility to train driving experience in a safe environment. This report presents studies aimed to map driving simulator use for driver training in Denmark and to develop a training to improve young drivers’ HPS in the driving simulator. Mapping the use of a driving simulator for driver training purposes shows that driving simulators are not widely used in Denmark. However, instructors and driving coaches from institutions that have experience in driver training stated many advantages for simulator use. In Denmark, driving simulators are mainly used for regular driver training and teaching basic driving skills, such as starting and manoeuvring a vehicle in different traffic situations. The use of simulator training of higher-order skills, such as HPS, is neglected.

Prior to development of the training for young drivers, a preparatory experiment was carried out. The results indicated the need for training focusing not only on the detection, but also on an adequate response to hidden pedestrian-related potential hazards that demand more advanced HPS. Based on the results, the training procedure was developed, consisting of a training drive, a video with an expert commentary and a replay of the training drive. The training aimed to improve young drivers’ hazard detection and response in pedestrian-related potential hazard situations. The results demonstrated that the training had a beneficial effect on improved tactical HPS, particularly in relation to more challenging, hidden pedestrian-related potential hazards. Improvement in advanced HPS suggests that it is relevant to consider ways to include similar training procedures in basic driver training to support the development of more advanced HPS among newly licensed drivers. This type of training program in the driving simulator, further improved, could be considered as an additional tool to improve the driver learning curriculum in addition to the traditional means of driver training.

Enkeltstående reklametavler fanger bilisters visuelle opmærksomhed
En undersøgelse fra USA har fundet, at enkeltstående reklametavler placeret i et miljø uden andre visuelle forstyrrelser (fx andre reklamer eller trafikskilte) fanger bilisters visuelle opmærksomhed.

En vognbanealarm kan hjælpe ældre til at køre mere sikkert
En ny undersøgelse fra USA har igennem et simulatorforsøg vist, at ældres evne til at reagere hurtigt, hvis bilen utilsigtet er ved at skifte vognbane, kan blive ligeså god som yngre bilisters, hvis de får hjælp af en vognbanealarm.

Forbedring af unges evne til at forudsige potentielle farer i trafikken vha. kørselssimulatortræning
Unge bilister forbliver overrepræsenterede i trafikulykkesstatistikker. Bilisters evne til at identificere potentielle risikosituationer samt til at reagere adækvat i disse situationer forbedres gradvist baseret på erfaring med håndtering af en bred vdte af trafikale situationer. Internationalt betegnes denne evne ofte som hazard perception skills (HPS). Formålet med denne undersøgelse er at afdække, om yngre bilisters HPS i fodgængerrelaterede situationer kan forbedres gennem et specialdesignet træningsforløb, gennemført i en kørselssimulator. Træningsforløbet omfattede en kombination af træningskørsel i en kørselssimulator, en video med et lydspor med ekspertkommentarer vedr. bilkørsel samt en afspilning af deltagernes egen træningskørsel. 30 unge bilister modtog træning og deres resultater blev sammenlignet med 30 utrænede bilister. Sammenligningen blev baseret på deres visuelle fikseringer og køreadfærd i potentielt kritiske fodgængerrelaterede situationer af varierende kompleksitet. Resultaterne viste, at trænede bilister reagerede på en af tre skjulte farer ved at reducere hastigheden, mens utrænede bilister ikke gjorde. Analysen af deltageres visuelle fikseringer viste, at de trænede bilister oftere fikserede på steder, hvor farer kunne være skjult. Derudover havde trænede bilister lavere selvvurderet HPS efter træningen end før træningen. Interventionen havde en positiv effekt med hensyn til at forbedre bilisternes kørehastighed og visuelle fikseringer i potentielt kritiske fodgængerrelaterede situationer, hvilket kræver mere avancerede HPS. Resultaterne tyder på, at interventionen med fordel kan videreudvikles med henblik på at implementere et ekstra modul, som led i den kørskolebaserede køreundervisning, for at sikre nye bilister de bedst mulige HPS, når de får kørekørt.
Forringet livskvalitet efter trafikulykker

En ny litteraturundersøgelse har vist, at personer med langtidsfølger efter en trafikulykke oplever nedsat livskvalitet.

Hvad gør trafikanter vrede? Analyse af situationer med vejvrede og forskelle mellem trafikanttyper

Formålet med denne undersøgelse var at opnå større viden om hvilke trafikale situationer, som udløser vrede hos forskellige trafikantgrupper. Datagrundlaget for undersøgelsen var en repræsentativ spørgeskemaundersøgelse blandt 2000 personer i Danmark. Analyserne viste, at trafikanter særligt ofte bliver vrede over to typer af adfærd hos andre trafikanter: uopmærksomhed/manglende orientering og hensynsløshed. Analyserne viste desuden en række forskelle mellem undergrupper i befolkningen, fx bliver kvinder oftere end mænd vrede over farlig adfærd, og mænd bliver vrede over bilister, som holder i vejen. Generelt bliver individer oftest vrede over adfærd, som går ud over dem selv – fx bliver bilister vrede over andre bilister, som trækker for tæt ind foran, og cyklister bliver vrede over fodgængere på cykelstierne.

Kvalitativ undersøgelse af forældres holdning til knallertkørsel med fokus på sikkerhed og mobilitet: Delnotat V

Formålet med denne del-undersøgelse er at afdække forældres opfattelse af deres børns daglige transport herunder deres holdning til en eventuel sænkelse af kørekortalderen for knallert 45 og lille motorcykel. I undersøgelsen er der fokus på sikkerhed og mobilitet.

Kvalitativ undersøgelse af unge knallertkøreres holdning til knallertkørsel med fokus på mobilitet og sikkerhed: Delnotat VI

Formålet med denne del-undersøgelse er at opnå en mere dybdegående indsigt i unge knallertkøreres holdninger, vaner, mobilitetsbehov og risikoforståelse. Undersøgelsen tager udgangspunkt i unges mobilitetsbehov og –vaner, og baserer sig på fire kvalitative fokusgruppeinterview fordelt på fire forskellige byer. Gennem fokusgruppeinterviewene afdækkes de unges transportvaner, holdninger og risikoafhængighed med henblik på at vurdere de mulige mobilitets- og sikkerhedsrelaterede konsekvenser en evt. aldersændring for kørekort til stor knallert og lille motorcykel ville kunne medføre.

Litteraturundersøgelser vedrørende tohjulede motorkøretøjer: Delnotat VII

Følgende notat indeholder fire litteraturundersøgelser, der hver især redegør for forskellige aspekter med relevans for vedr. ændrede aldersgrænser for erhvervelse af kørekort til stor knallert og lille motorcykel. Litteraturundersøgelserne er sammenfatninger baseret på gennemgange af den internationale forskningslitteratur og udarbejdet med henblik på at klarlægge den eksisterende viden og de relevante erfaringer ift. ændrede aldersgrænser. Litteraturundersøgelserne omhandler hhv.:

I. Ændrede aldersgrænsers betydning for unges transportmønstre
II. Tohjulede køretøjers betydning for trafiksikkerheden
III. Overførsel af kompetencer
IV. Etablering af transportvaner på længere sigt

Lysreklamer langs landets veje distraherer bilisterne

Udviklingen af LED-teknikken har gjort det muligt at fremstille større, bedre og billigere lysreklamer, som i stigende omfang opsættes langs vejene i Danmark. En ny dansk rapport har fundet, at bilisterne distraheres af disse lysreklamer i en sådan
Grad, at trafiksikkerheden mindskes.

Moped use – fact sheet: Delnotat II
The purpose of this fact sheet is to provide an overview of selected aspects regarding moped use and vmoped users in Denmark with regard to the period from 2013 to 2018.

It is commonly thought that mopeds are a means of transport used primarily by young people. However, based on the current analysis it appears that the usage of mopeds also applies to middleaged men who are more likely, not to hold a driver license. Additionally, the usage of mopeds is not just an urban phenomenon but also regards the countryside.

Road anger expression—Changes over time and attributed reasons
Based on the results from three independent surveys conducted in Denmark in 2005, 2008 and 2016, this paper provides an overview of the development of road anger expression in general and in demographic sub-groups of road users. In addition, it investigates how people explain own and other people’s road anger expression and if attributed reasons are related to demographic factors and level of anger expression measured based on the short form of the driving anger expression inventory (DAX-short). From 2005 to 2016 the percentage of people involved in anger expression incidents increased particularly in the densely populated Capital Region of Denmark. The increase was most pronounced for “yelling” and “threatening”. Men were more often involved than women both as aggressor and as victim, but the gender difference decreased from 2008 to 2016. Generally, own anger expression was more often explained with getting frightened (non-hostile attribution), while anger expression by other road users was more often explained by not being able to control own anger or by wanting to show that one made a mistake (hostile attribution). However, people scoring high in aggressive anger expression often explained own anger expression by “not being able to control anger”, thereby indicating self-reflection and a potential for behavioural change. Behavioural reactions to being frightened are to some extend mistakenly interpreted as expressions of anger by other road users. Results indicate that cognitive and behavioural interventions, possibly as part of the driver education, are relevant to reduce aggressive anger expression in traffic.

The road and its influence on bicycle accidents in Denmark
The National accident database is often used as basis when designing and prioritizing safety initiatives for cyclists. Due to the very low reporting rate this is not optimal. The purpose of this study is to get a better understanding of factors influencing the occurrence of cyclist accidents with a particular focus on the influence of the condition of the road. The study is based on data on cyclist injuries reported to the hospital and merged with road data, including information on road condition and existence of bicycle lane. The data is analyzed using a Latent Class Clustering approach for pattern recognition. The analysis uncovers patterns of road maintenance and cyclists accidents and reveals 11 clusters. The results identify the road condition as a significant factor for many of the accidents, especially for accidents involving less experienced cyclists. In addition, the analysis confirms that the use of medical records together with road maintenance data leads to new insight of the occurrence of bicycle accidents, which is relevant for the prioritization of preventive efforts.

General information
Uheldsmodellering: Belægningsskader og risiko
Der investeres mange penge i vejvedligeholdelse i Danmark, men hvor stor en betydning har belægningsskader egentlig for uheldsrisikoen. Dette studie har tilvejebragt ny viden om dette og fundet, at især belægningsskader som lapper og sporkøring kan forøge uheldsrisikoen på de kommunale veje. Studiet viser dog også, at mangel på data giver store udfordringer, og at det derfor fremadrettet er vigtigt at sikre bedre data for veje og trafikuheld. Studiet er del af et større projekt som skal afdække infrastrukturens betydning for trafikuheld. Projektet udføres på DTU og er finansieret af Asfaltindustrien samt Sikre Veje.

Young drivers' perception of adult and child pedestrians in potential street-crossing situations
Despite overall improvements in road traffic safety, pedestrian accidents continue to be a serious public health problem. Due to lack of experience, limited cognitive and motoric skills, and smaller size, children have a higher injury risk as pedestrians than adults. To what extent drivers adjust their driving behaviour to children's higher vulnerability is largely unknown. To determine whether young male drivers' behaviour and scanning pattern differs when approaching a child and an adult pedestrian in a potential street-crossing situation, sixty-five young (18-24) male drivers' speed, lateral position and eye movements were recorded in a driving simulator. Results showed that fewer drivers responded by slowing down and that drivers had a higher driving speed when approaching a child pedestrian, although the time of the first fixation on both types of pedestrians was the same. However, drivers drove farther away from a child than an adult pedestrian. Additionally, fewer drivers who did not slow down fixated on the speedometer while approaching the child pedestrian. The results show that young drivers behave differently when approaching a child and an adult pedestrian, though not in a way that appropriately accounts for the limitations of a child pedestrian. A better understanding of how drivers respond to different types of pedestrians and why could contribute to the development of pedestrian detection and emergency braking systems.
Accuracy of young male drivers’ self-assessments of driving skill

Accurate self-assessment of skill is important because it creates an appropriate level of confidence and hence behaviour. Inaccurate self-assessment of driving ability has been linked to reckless driving and accidents. Inaccurate self-assessment of driving skills may be a contributing factor to the over-representation of young male drivers in accident statistics. Most previous research on self-assessment of driving skills did not compare self-reported skills to objectively measured driving skills, so the aims of this study were: (1) to test the accuracy of young male drivers’ self-assessments of specific driving skills by comparing them with performance in a driving simulator; (2) to test whether self-assessment accuracy varied with driving skill, driving experience and sensation-seeking propensity. We found that young male drivers’ self-assessments were inconsistent with their driving performance, and that this inconsistency varied with driving skill, driving experience and sensation-seeking propensity. Groups with particularly inaccurate self-assessments are at high risk, because of their relative lack of skill, high mileage and sensation-seeking propensity. Self-assessments of hazard prediction and detection skills were particularly inaccurate. Understanding self-assessments of driving skill is crucial, but further studies are needed to allow preventive policies and interventions to take factors affecting self-assessments into account.

Anger expression among Danish cyclists and drivers: A comparison based on mode specific anger expression inventories
Based on the short form of the driving anger expression inventory (DAX-short, 15-item), the present study developed an adapted version of the DAX for cyclists (CAX, 14 items). The data basis was an online survey of 2000 inhabitants of Denmark. A principle component analysis on the translated DAX-short confirmed the 4-factor solution of the original study differentiating between (1) personal physical aggressive expression, (2) use of a vehicle to express anger, (3) verbal aggressive expression and (4) adaptive/constructive expression. In case of cycling, the factor "use of a vehicle to express anger" only included one item and was left out. Based on the results, reliable subscales were developed. Drivers scored higher in verbal aggressive expression than cyclists, while there was no significant difference in constructive expression. The subscales for drivers and cyclists showed significant relations to age, gender, self-reported aggressive behaviours and traffic fines: Women scored for instance lower in physical expression, while older people scored higher in constructive expression. The effect of age and gender on anger expression among drivers and cyclists remained significant when controlling for exposure and other factors in linear regression analyses. These analyses also showed a relationship between a positive attitude towards driving and higher levels of anger expression among drivers, while this was not the case for cyclists.

Bedre trafikuheldsdata: Danske erfaringer med brug af forskellige typer trafikuheldsdata
Viden om trafikuheld er en vigtig forudsætning for effektivt at kunne forbedre trafiksikkerheden, dels for at forstå de mekanismer, der ligger til grund for uheldebærende opståen, dels for at kunne tilrettelægge målrettede uheldsforebyggende tiltag og dels for at kunne foretage en kvalificeret prioritering mellem forskellige tiltag, når det er pårævet. Det er velkendt, at en stor andel af de trafikuheld, der finder sted, af forskellige grunde ikke registreres i den officielle, nationale trafikuheldsstatistik. Dette gælder i særlig grad eneuheld og cyklistuheld. Blandt fagpersoner med behov for faktuel viden
om trafikuheld i Danmark har der derfor gennem snart mange år været et ønske om at forbedre datagrundlaget fx gennem inddragelse af andre datakilder som supplement til de politiregistrerede trafikuheldsdata. Trods en række forskellige lokale og regionale initiativer gennem årene er det imidlertid endnu ikke lykkedes at finde en national model for inddragelse af sådanne supplerende datakilder. Som led i processen mod et bedre datagrundlag for trafikuheld har Transport DTU/DTU Management Engineering, med støtte fra TrygFonden, gennemført nærværende projekt. Formålet har været at tilvejebringe et nationalt overblik over eksisterende datakilder vedr. trafikuheld, nuværende erfaringer med supplerende datakilder samt behov og forventninger blandt udvalgte interessenter vedrørende nuværende og fremtidig anvendelse af supplerende datakilder.

Comparison between young male drivers' self-assessed and objectively measured driving skills
Self-assessment of skills is a self-generated feedback process that contributes to confidence in one's skills. The higher one's self-assessed skills, the more likely one is to feel competent a particular domain thereby influencing the related behaviors. Drivers' self-assessed driving skills are not always accurate, which may cause serious problems such as underestimation of risk, reckless driving and accidents. Most previous research on self-assessment of driving skills did not compare self-reported skills to objectively measured driving skills, so the aim of this study was to test the accuracy of young male drivers' self-assessments of driving skills using a driving simulator, and to examine whether self-assessment accuracy varied with driving skill, experience or sensation-seeking propensity. Results showed that the drivers' self-assessments were inconsistent with their driving performance, and this inconsistency varied with driving skill, driving experience and sensation-seeking propensity in a safety-critical way.

Cyklistuheld – hvilken betydning har vejen, køretøjet og trafikanten

Er vejvrede en uheldsfaktor
En ny undersøgelse fra Canada viser, at bilister der udviser aggression, når de kører bil, i højere grad er involveret i færdselsuheld end bilister, der ikke udviser aggression, er. Dette gælder også for bilister, der kun udviser mindre alvorlige former for aggression som fx at bande, lave fagter eller råbe ad andre trafikanter. Der mangler dog stadig viden om, hvorfor aggression i trafikken giver øget uheldsrisiko.

Har kørebanens bredde betydning for trafikanters adfærd?
En ny undersøgelse fra Tyskland viser, at bredden af venstre kørebane på motorvejstrækninger med vejarbejde har betydning for trafikanternes adfærd. Jo smalleere kørebanen er, jo langsommere kører trafikanterne og jo længere trækker de til højre. Det har dog samtidig den negative sideeffekt, at antallet af kollisioner mellem trafikanter i venstre og højre kørebane stiger.
**Harmonisering af retningslinjer vedrørende vejarbejde**

Effektiv regulering af kørehastigheden er et vigtigt element for øget sikkerhed i forbindelse med vejarbejde. I et projekt med deltagelse fra flere europæiske lande har man lavet et overblik over anvendte virkemidler samt en vurdering af deres potentielle effektivitet med hensyn til at kunne bidrage til at reducere kørehastigheden i forbindelse med vejarbejde. Projektet er tænkt som et første skridt i retning mod harmonisering af retningslinjer for hastighedsregulering ved vejarbejde inden for Europa.

**How indicative is a self-reported driving behaviour profile of police registered traffic law offences?**

Although most motorised countries have experienced massive improvements in road safety over the last decades, human behaviour and differences in accident risk across sub-groups of drivers remains a key issue in the area of road safety. The identification of risk groups requires the identification of reliable predictors of safe or unsafe driving behaviour. Given this background, the aim of this study was to test whether driver sub-groups identified based on self-reported driving behaviour and skill differed in registered traffic law offences and accidents, and whether group membership was predictive of having traffic law offences. Sub-groups of drivers were identified based on the Driver Behaviour Questionnaire (DBQ) and the Driver Skill Inventory (DSI), while traffic offences and accidents were register-based (Statistics Denmark). The participants (N = 3683) were aged 18–84 years and randomly selected from the Danish Driving License Register. Results show that the driver sub-groups differed significantly in registered traffic offences but not in registered accidents. In a logistic regression analysis, the sub-group “Violating unsafe drivers” was found predictive of having a traffic offence, even when socio-demographic variables and exposure were controlled for. The most important predictive factor, however, was having a criminal record for non-traffic offences, while gender, living without a partner, and being self-employed also had a significant effect. The study confirms the use of the DBQ and DSI as suitable instruments for predicting traffic offences while also confirming previous results on accumulation of problematic behaviours across life contexts. The finding that driver sub-groups did not differ in registered accidents supports the recent research activities in finding and modelling surrogate safety measures.
Hvad kan man gøre ved vejvrede?
Det er ikke kun bilisten selv, der kan have gavn af tiltag, der reducerer forekomsten af vejvrede i trafikken. Også passagerer og andre trafikanter vil nyde godt af det, hvis forekomsten af pludselige, voldsomme og aggressive reaktioner i trafikken reducerses. I denne artikel skitseres forskellige tiltag til forebygelse af vejvrede blandt bilister. Forskningen tyder på, at tiltag kan reducere vejvrede, men der er endnu ikke grundlag for at udpege ét tiltag som det bedste.

Hvilke behov for støtte har ældre bilister, når de kører bil?
Den teknologiske udvikling har i de seneste år ført til udvikling af en række fører-støtte-systemer, der på forskellig måde kan hjælpe bilisten under kørslen. Det er muligt, at sådanne systemer også vil kunne være en hjælp for ældre bilister. En ny svensk undersøgelse viser, at systemer, der kan hjælpe ældre i situationer, hvor de er nødt til at dele deres opmærksomhed mellem forskellige trafikrelaterede ting, hjælpe dem under kørsl i tæt trafik, og som løbende kan give dem faktuel information fx om den aktuelle hastighedsgrænse, er relevante.

Ny undersøgelse: aggressionsniveauet er lavere blandt motorcyklister

En ny australsk undersøgelse har set på, om det har betydning for trafikanters aggressionsniveau, hvilket køretøj de benytter. Undersøgelsen viser, at køretøjet påvirker aggressionsniveauet, idet deltagerne var mindre tilbøjelige til at udvise aggression som motorcyklist end som bilist. Undersøgelsen viser endvidere, at der både er ligheder og forskelle med hensyn til, hvilke faktorer der påvirker aggressionsniveauet for de to køretøjstyper.

Risikofaktorer ved vejarbejde

Uheldsriskoen er forøget på strækninger med vejarbejde. En analyse af dødsuheld i USA viser, at særligt trafikanters manglende tilpasning af deres adfærd er en vigtig faktor i forbindelse med disse uheld. Tiltag der kan sikre et mere jævnt trafik-flow i passende lav fart på strækninger med vejarbejde er vigtige elementer i forebyggelsen.

Simulatorbaseret fodgængertræning af ældre

At finde et sikkert tidspunkt at krydse en trafikeret vej med blandet trafik og varierende kørehastigheder kan være vanskeligt, ikke mindst for ældre. En ny undersøgelse fra Frankrig tyder på, at træning i en fodgængersimulator kan bidrage til, at ældre fodgængers risikobevidsthed øges, så de bliver bedre i stand til at vælge sikre tidspunkter at krydse en vej på og risikoen for påkørsel reduceres.

**Synlig aktivitet ved vejarbejde sænker fart**

I en ny norsk undersøgelse har man set på, om synlig aktivitet i forbindelse med vejarbejde har betydning for bilisters foretrukne kørehastighed. Analysen viste, at bilister foretrækker en lavere kørehastighed, når der er synlig aktivitet og når de oplever, at der er en god grund til at sænke farten. Dette er vigtigt at tænke ind i forebyggende tiltag, der skal bidrage til en sikker kørehastighed blandt bilister.

**Tilpasser ældre deres kørsel, når de har kognitive svækkelser?**

At køre bil er en krævende opgave, og kognitive svækkelser kan derfor gøre det vanskeligt at køre trafiksikkert. En ny australisk undersøgelse tyder på, at ældre i nogen grad kompenserer for aldersrelaterede kognitive svækkelser uden selv at være opmærksom på, at de gør det. Undersøgelsen viser endvidere, at personer, der regelmæssigt kører med de ældre som passagerer, kan bidrage med vigtig information om, hvilke udfordringer de ældre bilister har, og hvordan de håndterer dem.

**Age and attitude: Changes in cycling patterns of different e-bike user segments**

The use and purchase of electric bicycles (e-bikes) is emerging in many countries. Existing knowledge about changes in cycling patterns and car replacement after gaining e-bike access is limited and partly contradictory. Based on an online survey among e-bike users in Denmark (N = 427), this study looked into these effects by differentiating between different segments of e-bike users. We distinguished four age groups as well as three segments based on cycling attitudes and motives for the use and purchase of e-bikes: (1) enthusiastic e-bikers who showed the most positive attitudes towards e-bikes and mainly bought an e-bike to increase cycling frequency; (2) utilitarian e-bikers who already cycled regularly before having access to an e-bike and used the e-bike particularly for practical purposes and to reduce travel time; (3) recreational e-bikers who were very positive about e-bike use but used it less regularly and mainly for long-distance recreational trips. Enthusiastic e-bikers reported the highest increase in overall cycling. Half of the enthusiastic e-bikers agreed that they bought the e-bike to replace a car. Differences between the four age groups were less pronounced. Nevertheless, we found that e-bike access decreased age differences in self-reported cycling frequency, whereas it increased differences in self-reported distances. Measures to increase e-bike use should primarily focus on potential enthusiastic e-bikers. Possible interventions include promotional campaigns at workplaces, intended to address not only instrumental but also affective motives of e-bike use.
Airbags til cyklister

En cykelhjelms størrelse og tykkelse er afgørende for dens evne til at dæmpe det stød som cyklister udsættes for i forbindelse med styrt og/eller kollision. Både praktisk og æstetisk er der dog grænser for, hvor stor en hjelm cyklister vil cykle rundt med. En gruppe amerikanske forskere har testet en ny type cykelhjelm, der udvider sig i forbindelse med styrt/kollision. Forskerne konkluderer, at den nye hjelmtype har potentiale til god beskyttelse mod hovedskader, men at der er behov en omfattende forskningsindsats før der kan konkluderes endeligt vedrørende den trafiksikkerhedsmæssige effekt.

Betydningen af sociale normer for distraktion under bilkørsel
En amerikansk undersøgelse viser, at sociale normer har betydning for unges involvering i distraherende aktivitet. Interventioner, der støtter forældre i at være gode rollemodeller og bidrager til at korrigere misforståelser angående omfanget af distraherende aktivitet blandt forældre og jævnaldrende kammerater, er derfor yderst relevante.

Distraktion er fortsat en risikofaktor

Distraktion er stadig en markant risikofaktor i trafikken
På foranledning af Rådet for Sikker Trafik har Transport DTU set på den nyeste forskningslitteratur vedrørende distraktion og bilkørsel. I det følgende præsenteres udvalgte resultater.

E-bike safety: Individual-level factors and incident characteristics
As electrically assisted bicycles (e-bikes) become more widespread, the number of crashes in which they are involved is also growing. We used data from a survey of 685 e-bike users in Denmark to examine the factors which contribute to perceived e-bike safety and involvement in safety critical incidents. Using regression analyses, we demonstrated that riding style and e-bike attitude played a crucial role in both perceived safety and involvement in safety critical incidents. Age and female gender were negatively associated with perceived safety. 29% of participants had experienced at least one safety critical incident that they believed would not have happened on a conventional bike. The most frequent explanation offered for these situations was that other road users had underestimated the speed of the e-bike, followed by rider problems regulating e-bike speed. Older cyclists were more likely to report problems maintaining balance due to the weight of the e-bike. Preventive measures discussed include awareness campaigns and making it easier to distinguish e-bikes from conventional bicycles to address the problem of underestimation of speed. We also identified a need to familiarise with the e-bike before using it in demanding traffic situations.

Effekt af cykeltræningskursus for forældre
I Østrig har man udviklet et kursus, der har det formål at hjælpe forældrene til bedre at kunne træne og vejlede deres børn til at blive sikre cyklister. Kurset er blevet evalueret, og evalueringen tyder på, at kurset både bidrager til at øge forældrenes kompetencer og engagement i deres børns cykeltræning samt vidt med at børnens faktiske cykelfærdigheder
forbedres. Det anbefales dog at foretage yderligere undersøgelser for at nuancere og cementere de positive resultater.

**Effekten af distraktion ved manuel overtagelse af bilkørslen**
En ny undersøgelse tyder på, at reaktionstid ikke er et godt mål for, i hvor høj grad bilisters kørsel bliver påvirket af distraherende aktiviteter i situationer, hvor bilisten skal overtage kørslen manuelt efter at have kørt i delvist automatiseret tilstand. Forklaringen kan være, at det at gribe efter et rat er en refleksagtig respons, der trækker på andre ressourcer end de kognitive og visuelle ressourcer, der er centrale for at køre sikkert.

**Factors contributing to young moped rider accidents in Denmark**
Young road users still constitute a high-risk group with regard to road traffic accidents. The crash rate of a moped is four times greater than that of a motorcycle, and the likelihood of being injured in a road traffic accident is 10-20 times higher among moped riders compared to car drivers. Nevertheless, research on the behaviour and accident involvement of young moped riders remains sparse. Based on analysis of 128 accident protocols, the purpose of this study was to increase knowledge about moped accidents. The study was performed in Denmark involving riders aged 16 or 17. A distinction was made between accident factors related to (1) the road and its surroundings, (2) the vehicle, and (3) the reported behaviour and condition of the road user. Thirteen accident factors were identified with the majority concerning the reported behaviour and condition of the road user. The average number of accident factors assigned per accident was 2.7. Riding speed was assigned in 45% of the accidents which made it the most frequently assigned factor on the part of the moped rider followed by attention errors (42%), a tuned up moped (29%) and position on the road (14%). For the other parties involved, attention error (52%) was the most frequently assigned accident factor. The majority (78%) of the accidents involved road rule breaching on the part of the moped rider. The results indicate that preventive measures should aim to eliminate violations and increase anticipatory skills among moped riders and awareness of mopeds among other road users. Due to their young age the effect of such measures could be enhanced by infrastructural measures facilitating safe interaction between mopeds and other road users.

Fodgængervenlige fronter
Risikoen for personskade er stor, når en fodgænger rammes af en bil. Fodgængervenlige fronter anses for at være en måde at bidrage til mindre tilskadekomst blandt fodgængere i trafikken. Denne undersøgelses resultater tyder på, at fodgængervenlige fronter under visse betingelser kan reducere risikoen for at fodgængere får varige mén i forbindelse med et færdselsuheld.

Hvad ved bilister egentlig om sikkerhedssteknologi i biler?
Potentialet for forbedret trafiksikkerhed gennem sikkerhedssteknologi er stort. En ny amerikansk undersøgelse viser dog, at bilisternes kendskab til og forståelse af hvordan sikkerhedssystemerne virker og skal benyttes er begrænset, selv for sikkerhedsudstyr, der i dag har stor udbredelse som fx ABS-bremser. Der er således behov for en informationsindsats ikke mindst i lyset af forventningen om stigende udbredelse af sikkerhedssteknologi i bilparken fremover.

Hvem skal overleve?
Konflikter i trafikken er uundgåelige, også selv om de måske bliver minimeret i forbindelse med selvkørende biler. I forbindelse med udviklingen af selvkørende biler, er det derfor nødvendigt, at der udarbejdes nogle principper for, hvordan selvkørende biler skal håndtere forskellige typer af konflikter, herunder de etiske og moralske dilemmaer der kan opstå.

Ja, cykelhjelmen beskytter!
Cykelhjelmens trafiksikkerhedsmæssige effekt har været genstand for omfattende debat. Baseret på en gennemgang af videnskabeligt publikerede resultater har to australske forskere lavet en metaanalyse med det formål at skabe et videnskabeligt baseret overblik over den eksisterende viden. Samlet viser metaanalysen, at anvendelse af cykelhjelm har en markant positiv effekt på hovedskader og ansigtsskader blandt tilskadekomne cyklister.

Kan mobiltelefonen bidrage til bedre trafiksikkerhed?
Mobiltelefonen er kommet for at blive, og rigtige mange bilister benytter den, mens de kører bil. Hvis mobiltelefonens funktioner kan udnyttes til fordel for trafiksikkerheden, rummer det derfor et stort potentiale, fordi det principielt er muligt at nå ud til mange bilister med begrænsede ressourcer. Som et første skridt på vejen har et ekspertpanel evalueret forskellige apps for at afdække deres trafiksikkerhedsforbedrende potentiale.

Lokomotivføreres adfærd og opmærksomhed

Mest trafiksikkerhed for pengene
Ny forskning fra DTU peger på, at det er muligt at forbedre prioriteringen af infrastrukturforsyninger på baggrund af viden om vejenes tilstand, de skønnede udbredingsomkostninger samt uheldsforekomst og alvorlighedsgrad.
Nyønskning af forebyggelse for unge trafikanter

Obligatorisk hjelmbrug giver færre alvorlige hovedskader

Oplevelsen af risiko i trafikken
A Go/No-go approach to uncovering implicit attitudes towards safe and risky driving

Self-report measures of driving-related attitudes and beliefs miss potentially important precursors of driving behaviour, namely, automatic and implicit thought processes. The present study used an adapted Go/No-go Association Task to measure implicit thought without relying on the participants' self-reports. Implicit attitudes towards safe and risky driving were measured in 53 Danish drivers (31 female, 22 male). Further, we explored the relationship between implicit attitudes towards risky and safe driving, and self-reported driving behaviour and skills. The results suggest that implicit attitudes towards driving behaviour can be measured reliably with the Go/No-go Association Task. Also, the results suggest that implicit attitudes towards safe driving and risky driving, respectively, may be separable constructs, and might thus stem from different cognitive processes. Finally, implicit attitudes were significantly related to self-reported driving behaviour and skills for male (but not female) drivers. Pending future research with larger sample sizes, the difference between implicit attitudes towards safe versus risky driving that we observed may contribute to a greater theoretical understanding of the causes of safe and risky driving.
for trafiksikkerheden, og at den menneskelige faktor fortsat vil være central i forbindelse med færdselsuheld.

Har automatisering betydning for bilisters opmærksomhed og mentale belastning?
Det er mindre mentalt krævende at køre i en automatiseret bil. I nogle situationer bidrager det til, at bilisten er ekstra opmærksom, mens det i anden situationer fører til, at bilisten er mindre opmærksom og dermed mindre klar til at reagere i en kritisk situation. Der er dog fortsat mange uafklarede spørgsmål vedrørende den sikkerhedsmæssige effekt af automatiseret bilkørsel.

Profiling drunk driving recidivists in Denmark

Drunk drivers are a menace to themselves and to other road users, as drunk driving significantly increases the risk of involvement in road accidents and the probability of severe or fatal injuries. Although injuries and fatalities related to road accidents have decreased in recent decades, the prevalence of drunk driving among drivers killed in road accidents has remained stable, at around 25% or more during the past 10 years. Understanding drunk driving, and in particular, recidivism, is essential for designing effective counter measures, and accordingly, the present study aims at identifying the differences between non-drunk drivers, drunk driving non-recidivists and drunk driving recidivists with respect to their demographic and socio-economic characteristics, road accident involvement and other traffic and non-traffic related law violations. This study is based on register-data from Statistics Denmark and includes information from 2008 to 2012 for the entire population, aged 18 or older, of Denmark. The results from univariate and multivariate statistical analyses reveal a five year prevalence of 17% for drunk driving recidivism, and a significant relation between recidivism and the drunk drivers’ gender, age, income, education, receipt of an early retirement pension, household type, and residential area. Moreover, recidivists are found to have a higher involvement in alcohol-related road accidents, as well as other traffic and, in particular, non-traffic related offences. These findings indicate that drunk driving recidivism is more likely to occur among persons who are in situations of socio-economic disadvantage and marginalisation. Thus, to increase their effectiveness, preventive measures aiming to reduce drunk driving should also address issues related to the general life situations of the drunk driving recidivists that contribute to an increased risk of drunk driving recidivism.

**Sikker overgang fra automatiseret til manuel kørsel.**

En ny svensk undersøgelse viser, at jo mere automatiseret bilkørslen er, jo længere er bilisten om at opdage det, hvis de automatiserede funktioner svigter. Undersøgelsen viser endvidere, at totale systemsvigt tilsyneladende er vanskeligere at opdage end delvise svigt i de automatiserede funktioner.

**Uforudsigelighed er værst.**

Det tager op til 40 sekunder for en bilist, der kører i en delvist automatiseret bil, at opnå stabil manuel kontrol over bilen, hvis der opstår en situation, hvor dette er påkrævet. Hvis behovet for manuel overtangelse opstår uventet, er bilisten længere om at rette sin visuelle opmærksomhed stabilt mod kørebanen, end hvis bilisten er forberedt på at skulle overtage kørslen.
The motivation underlying adolescents’ intended time-frame for driving licensure and car ownership: A socio-ecological approach

This study focuses on the adolescents’ intended time-frame for obtaining a driving license and purchasing a car, as the delay of these decisions will likely affect the amount of travel and transport externalities. Semi-structured interviews with 50 Danish adolescents were analyzed by means of deductive–inductive thematic narrative analysis based on the socio-ecological approach. The results show three groups in line with the market-diffusion model: intended early car users, intended early license holders and later car users, and intended late license holders and car users. The first group are car enthusiasts who associate cars with high instrumental, affective, symbolic, and relational values, have car-oriented social networks, and imagine a car-oriented lifestyle. The second group are car pragmatists, who associate cars with high instrumental and relational values, perceive car expenses as a barrier, and imagine a car-oriented lifestyle only in the long-term. The third group are car skeptics, who have low interest in cars and imagine a cycling-oriented future. Policy implications concern (i) promoting shared-responsibility among individuals, public bodies, communities and policy makers towards a sustainable future, (ii) applying a policy-package comprising complementary policy measures to target the three identified groups, (iii) relying on social networks for knowledge propagation and success of policy measures and educational campaigns, and (iv) promoting a tangible future vision based on sustainable modes.

Assessing the relationship between the Driver Behavior Questionnaire and the Driver Skill Inventory: Revealing sub-groups of drivers

The Driver Behavior Questionnaire and the Driver Skill Inventory are two of the most frequently used measures of self-reported driving style and driving skill. The motivation behind the present study was to identify sub-groups of drivers that potentially act dangerously in traffic (as measured by frequency of aberrant driving behaviors and level of driving skills), as
well as to test whether the sub-groups differ in characteristics such as age, gender, annual mileage and accident involvement. Furthermore, the joint analysis of the two instruments was used to test drivers’ assessment of their own self-reported driving skills and whether the reported skill level was reflected in the reported aberrant driving behaviors. 3908 drivers aged 18–84 participated in the survey. K-means cluster analysis revealed four distinct sub-groups that differed in driving skills and frequency of aberrant driving behavior. The sub-groups also differed in individual characteristics and driving related factors such as annual mileage, accident frequency and number of tickets and fines. The differences between the sub-groups suggest heterogeneity across the population, and since two of the sub-groups reported higher frequency of driving aberrations and lower skill level, they seem more unsafe than the two others. The results suggest that drivers’ assessment of their driving skills is reflected in their aberrant driving behaviors, as drivers who report low levels of driving skills, also report high frequency of aberrant driving behaviors, and vice versa. The present findings highlight the need to look into driver’s attitudes towards safety, and to devise differential interventions targeting specific problematic groups of the population in the attempt to improve road safety nationwide.

ADHD - en risikofaktor i trafikken?
Tidligere undersøgelser tyder på, at personer med ADHD har større risiko for at blive involveret i et færdselsuheld, når de kører bil, end personer, der ikke har ADHD. Tidligere undersøgelsesresultater har dog været meget forskellige, ikke mindst fordi man har benyttet forskellige metoder og inddraget forskellige aspekter. En ny metaanalyse viser, at personer med ADHD har øget uheldsrisiko, men at risikoen er mindre end hidtil antaget.

Det vigtigste er, hvad vi gør, ikke hvad vi siger
En ny canadisk undersøgelse om privat øvelseskørsel viser, at forældres instruktioner til deres børn om trafiksikker bilkørsel ikke kan opveje betydningen af forældrenes egen kørestil. Den måde forældre kører på, har således større indflydelse på deres børns kørsel, end det forældrene siger om, hvordan man ber køre. Effekten af det forældrene siger, er dog forskellig alt efter, hvilken type risikoadfærd der er tale om.

Færdselstavler – bliver de set af bilisterne?
Færdselstavler er et centralt element til forbedring af trafiksikkerheden gennem regulering af trafikanter adfærd. Der mangler imidlertid viden om, i hvilken udstrækning trafikanter faktisk ser de færdselstavler, der sættes op. I Italien har man derfor lavet en undersøgelse for at afdekke dette.

Obstruktiv søvnapnø og trafiksikkerhed

Forskning tyder på, at personer med obstruktiv søvnapnø har øget risiko for involvering i færdselsuheld, men der mangler fortsat viden på området. I en europæisk undersøgelse har en gruppe forskere derfor set på forekomsten af forskellige risikofaktorer blandt personer med obstruktiv søvnapnø. I undersøgelsen blev der endvidere set på, om der er sammenhæng mellem graden af obstruktiv søvnapnø og personens risiko for involvering i et færdselsuheld.

Peer influence on speeding behaviour among male drivers aged 18 and 28

Despite extensive research, preventive efforts and general improvements in road safety levels, the accident risk of young male drivers remains increased. Based on a standardized survey of a random sample of 2,018 male drivers at the age of 18 and 28, this study looked into attitudes and behaviours related to traffic violations of male drivers. More specifically, the role of peer influence on speeding was examined in both age groups. In regression analyses it could be shown that the descriptive subjective norm, i.e. the perception of friends’ speeding, was the most important predictor of speeding in both age groups. Other significant factors were: negative attitude towards speed limits, injunctive subjective norm, and the perceived risk of having an accident when speeding. In the older age group it was more common to drive faster than allowed and their speeding was largely in line with the perceived level of their friends’ speeding. In the younger age group a higher discrepancy between own and friends’ speeding was found indicating that young male drivers are socialized into increased speeding behaviour based on peer pressure. By contrast for the 28-year-olds peer pressure mainly seems to maintain or justify individual speeding behaviour. It is suggested that preventive measures should take these different influences of peer pressure into account by using a peer-based approach for the 18-year-olds and a more individual approach for the 28-year-olds.

Regler og rollemodeller

En amerikansk undersøgelse tyder på, at hvis man ønsker, at flere børn skal bruge cykelhjelm er det ikke nok, at forældrene er gode rollemodeller ved selv at bruge hjelm. Forældrene skal også stille krav om, at deres børn bruger hjelmen. Undersøgelsen tyder desuden på, at de krav forældre stiller til deres børn, både er påvirket af, hvilke krav de tror andre forældre stiller, og om de tror, at deres børns venner bruger cykelhjelm.

Risikoadfærd blandt el-cyklister

Anvendelsen af el-cykler er steget dramatisk i Kina i de senere år. El-cykler har mange fordele, men udgør samtidig en risikofaktor i trafikken. En undersøgelse fra Kina viser, at el-cyklistere kører mere risikabelt end cyklister, der kører på en konventionel cykel, gør.

Risikoadfærd blandt el-cyklister

Socialt pres bag mobiltelefoni
Brug af mobiltelefon under bilkørsel øger risikoen for at blive involveret i et færdselsuheld.

Trafiksikkerhedskultur blandt erhvervschauffører
En ny undersøgelse fra Tyrkiet viser, at erhvervschaufførers oplevelse af sikkerhedskulturen i den virksomhed, hvor de arbejder, har stor betydning for deres kørestil.

Trafiksikkerhedskultur blandt norske cyklister
En ny norsk undersøgelse viser, at cyklisters holdning til trafiksikkerhed er afgørende for deres adfærd i trafikken. Undersøgelsen viser endvidere, at cyklisters opfattelse af, hvordan deres nære venner og kolleger opfører sig i trafikken, har stor betydning for deres holdning til trafiksikkerhed dermed også for deres adfærd.
Trafiksikkerhedskulturen mange dimensioner

En ny undersøgelse tyder på, at der er forskel på, hvordan trafikanter orienterer sig, og hvor meget vægt de tillægger forskellige former for information, når de færdes i trafikken, alt efter hvilket land de kommer fra. Der er brug for yderligere viden, men på længere sigt kan en mere nuanceret forståelse af trafikkulturen i det enkelte land være relevant at inddrage ved tilrettelæggelse af forebyggende tiltag.

Uheld med el-cykler

Ældre bilisters selvregulering af deres kørselsmønster
I to nye undersøgelser har man set på, hvad begrebet selvregulering dækker over i relation til ældre bilister. Endvidere har man set på, hvor pålidelige ældres egne oplysninger om selvregulering er, og i hvor høj grad selvregulering forekommer. Undersøgelserne viste blandt andet, at pålideligheden af ældres oplysninger om eget kørselsmønster er høj men også, at det er afgørende at kende motivationen bag ældres kørselsmønster for at kunne afgøre, om der er tale om selvregulering eller ej.

Danske ældres oplevelse af ændringer i egne kørefærdigheder
To forskere fra DTU Transport har undersøgt, om ældre bilister oplever, at deres kørefærdigheder ændrer sig med alderen. Forskerne har endvidere set på, om der er forskel blandt ældre mænd og kvinder med hensyn til oplevelsen af ændringer i egne kørefærdigheder samt eventuelle konsekvenser for omfanget af bilkørsel.

Understanding adolescents' intentions to commute by car or bicycle as adults
This study focuses on the intentions of adolescents to commute by car or bicycle as adults. The behavioral model is based on intrapersonal and interpersonal constructs from the theory of planned behavior extended to include constructs from the institutional, community and policy domains. Data from a survey among Danish adolescents is analyzed. It is found that car use intentions are related to positive car passenger experience, general interest in cars, and car ownership norms, and are negatively related to willingness to accept car restrictions and perceived lack of behavioral control. Cycling intentions are related to positive cycling experience, willingness to accept car restrictions, negative attitudes towards cars, and bicycle-oriented future vision, and are negatively related to car ownership norms. Attitudinal constructs are related to individual characteristics, such as gender, residential location, current mode choice to daily activities, and parental travel patterns.
Keep on cruising: Changes in lifestyle and driving style among male drivers between the age of 18 and 23

Despite recent improvements in general road safety levels, young male drivers in most western countries continue to be overrepresented in road traffic accidents. Lifestyle related motivational factors are a key element in the young male driver problem. Based on 379 posted questionnaires completed by the same male drivers at the age of 18 and again at the age of 23, this study examined changes in the relationship between lifestyle and driving style over a 5 year period. A number of changes in car use, driving style and engagement in different leisure time activities were found. Cruising was related to an extrovert social life as well as problem behaviours such as drink driving. At the age of 18 cruising was a part of the normal social life of the majority of the participants. However, while most drivers reduced their level of cruising as well as related problem behaviour over time, a smaller group still showed a similar life style at the age of 23. The study confirmed the importance of lifestyle related motivational factors for driving behaviour among young drivers. © 2013 Elsevier Ltd. All rights reserved.
En gang cruiser – altid cruiser?
Cruising er relateret til risikoadfærd, uanset om bilisten er 18 eller 23 år gammel. De bilister, der fortsætter med at cruise som 23-årige, udgør en særlig risikogruppe, idet de også udviser andre former for risikoadfærd som fx manglende selebrug og øget spirituskørsel.

Forebyggelse af motorcykeluheld

Langvarige men af færdselsuheld
Age, gender, mileage and the DBQ: The validity of the Driver Behavior Questionnaire in different driver groups

The Driver Behavior Questionnaire (DBQ) is one of the most widely used instruments for measuring self-reported driving behaviors. Despite the popularity of the DBQ, the applicability of the DBQ in different driver groups has remained mostly unexamined. The present study measured aberrant driving behavior using the original DBQ (Reason, J.T., Manstead, A., Stradling, S.G., Baxter, J., Campbell, K., 1990. Errors and violations on the road – a real distinction. Ergonomics, 33 (10/11), 1315–1332) to test the factorial validity and reliability of the instrument across different subgroups of Danish drivers. The survey was conducted among 11,004 Danish driving license holders of whom 2250 male and 2190 female drivers completed the questionnaire containing background variables and the DBQ. Exploratory and confirmatory factor analysis showed that the original three-factor solution, a four-factor solution and a two-factor solution had acceptable fit when using the whole sample. However, fit indices of these solutions varied across subgroups. The present study illustrates that both the original DBQ and a Danish four-factor DBQ structure is relatively stable across subgroups, indicating factorial validity and reliability of the DBQ. However, as the Danish DBQ structure has an overall better fit, the present study highlights the importance of performing an explorative analysis when applying the DBQ in order to assess the problem areas within a driving population. © 2013 Elsevier Ltd. **Driver style and driver skill – Clustering sub-groups of drivers differing in their potential danger in traffic**
The Driver Behavior Questionnaire (DBQ) and the Driver Skill Inventory (DSI) are two of the most frequently used measures of self-reported driving style and driving skill. The motivation behind the present study was to test drivers’ consistency or judgment of their own self-reported driving ability based on a combined use of the DBQ and the DSI. Moreover, the joint use of the two instruments was applied to identify sub-groups of drivers that differ in their potential danger in traffic (as measured by frequency of aberrant driving behaviors and level of driving skills), as well as to test whether the sub-groups of drivers differed in characteristics such as age, gender, annual mileage and accident involvement. 3908 drivers aged 18–84 participated in the survey. The results suggested that the drivers are consistent in their reporting of driving ability, as the self-reported driving skill level mirrored the self-reported frequency of aberrant driving behaviors. K-means cluster analysis revealed four distinct clusters that differed in the frequency of aberrant driving behaviors, as well as individual characteristics and driving related factors such as annual mileage, accident frequency and number of tickets and fines. These differences between the clusters suggest that two of the sub-groups are less safe than the two others. The present findings highlight the need to look into driver’s attitudes towards safety, in order to improve the motivation to drive safely. Information from this study is useful for interventions to be able to target specific problematic groups of the population in the attempt to improve road safety nationwide.

**Implicit attitudes towards risky and safe driving**
Implicit social cognitions are thought processes that are not accessible to conscious introspection. These automatic processes can be measured with simple computer tasks that do not rely on participants' self-reports. Across a broad range of research areas (e.g., stereotyping; prejudice; consumer choice; health behavior), measures of implicit cognition have been shown to predict behavior particularly well if the behavior is associated with social desirability concerns and/or if a decision must be made spontaneously.

Driving behavior is characterized by frequent decisions under time pressure; further, self-reports of the intention to drive safely (or not) are socially sensitive. Therefore, we examined automatic preferences towards safe and risky driving with a Go/No-go Association Task (GNAT). The results suggest that (1) implicit attitudes towards driving behavior can be measured reliably with the GNAT; (2) implicit attitudes towards safe driving versus towards risky driving may be separable constructs.

We propose that research on driving behavior may benefit from routinely including measures of implicit cognition. A practical advantage is a lesser susceptibility to social desirability biases, compared to self-report methods. Pending replication in future research, the apparent dissociation between implicit attitudes towards safe versus risky driving that we observed may contribute to a greater theoretical understanding of the causes of unsafe and risky driving behavior.

**Risiko i trafikken og den menneskelige faktor**
I ca. 85 % af alle vejtrafikudfordringer er trafikantens adfærd en afgørende faktor ved uhelbet. Hvis man kan påvirke trafikanternes handlinger i en mere hensigtsmæssig retnin, kan mange færdselsuhelde derfor undgås. Inden man når dertil, er det dog nødvendigt først at forstå, hvorfor trafikanter i nogle tilfælde opfører sig uansigt og for en livsfarlig trafik. Trafikpsykologi er en anvendt disciplin, der benyttes til at forstå og forbedre trafikens sikkerhed. I dette kapitel gives en kort introduktion til den menneskelige faktors betydning for trafiksikkerheden. Endvidere tydeliggøres det vha. fænomener som distraktion og vejvrede, at det har store sikkerhedsmessige konsekvenser, hvis andre motiver end sikkerhed bliver bestemmende for trafikanternes adfærd.

The Driver Behavior Questionnaire (DBQ) is used to measure aberrant driver behavior by asking drivers how often they engage in various aberrant driver behaviors. Since the development of the original DBQ, several modified versions have been developed. The difference between the various versions is that new items are added or existing items modified or excluded. However, despite the differences, all versions are relatively long and therefore time-consuming and tiring to answer, which might limit the usability of the instrument. The main purpose of the present study was to develop a mini DBQ version by reducing the 27-item original DBQ to the shortest possible DBQ version. A second aim was to explore the feasibility of a second-order structure within the data, which means that violations, errors and lapses factors load on a higher-order aberrant driver behavior factor. The presence of a second-order structure further indicates the validity of the DBQ and its theoretical structure. Confirmatory factor analysis (CFA) was used to test the fit (i.e., how well the models explain the data) of the original DBQ versus the fit of the shortest possible DBQ, as well as the presence of a second-order structure for the DBQ. The results identified a nine-item Mini-DBQ. In addition, a second-order structure was established in the data. These findings indicate that the Mini-DBQ is a valid and useful short measure of aberrant driver behavior.

We are the future: understanding adolescents' intentions to commute by car or bicycle as adults

This study focuses on the intentions of adolescents to commute by car or bicycle as adults, as key elements towards promoting societal transition towards sustainable modes. The behavioral model is based on the theory of planned behavior combined with positive current travel experience, willingness to accept car restrictions, transport-related future vision, environmental concern and social influence. Data are retrieved from a survey among 15-years old Danish adolescents, and are analyzed with structural equation models. Results show: (i) car use intentions are positively related to positive car passenger experience, general interest in cars, and car-ownership norms, and are negatively related to willingness to accept car restrictions and perceived lack of behavioral control; (ii) cycling intentions are positively related to positive cycling experience, willingness to accept car restrictions, negative attitudes towards cars, and bicycle-oriented future vision, and are negatively related to car-ownership norms; (iii) attitudinal constructs are related to individual characteristics, such as gender, residential location, current mode choice to daily activities, and parental travel patterns.
Er indholdet af privat og professionel øvelseskørsel forskelligt?

Forældres reaktion er vigtig
Tidligere undersøgelser har dokumenteret, at forældre er vigtige rollemodeller for unge bilister. I Australien har man set på, hvordan forældre rent faktisk reagerer, når deres søn/datter kører risikobetonet samt på de unges egen oplevelse af påvirkning fra forældrene.

Forældrestøtte justeres efter situationen
En af de måder, som forældre kan påvirke små børns trafikadfærd på, er ved at holde opsyn med dem og give dem gode råd, når de færdes i trafikken. I den undersøgelse, der refereres her, blev der set på, hvilken betydning trafiksituationen, barnets alder og forældrenes risikoopfattelse har på, i hvilket omfang og på hvilken måde forældre hjælper deres børn over vejen.
Forældrestøtte reducerer risikokørsel

Omfanget af privat øvelseskørsel
I USA er privat øvelseskørsel en obligatorisk del af det at tage kørekort. Men der mangler viden om, hvor mange timer privat øvelseskørsel teenagere bør have, og hvor mange timers øvelseskørsel de faktisk får. Formålet med den artikel, der refereres her, var, at kvantificere, hvor mange timer forældre bruger på privat øvelseskørsel med deres teenagere i forskellige stater i USA. Undersøgelsen fokuserer på kvantiteten og ikke kvaliteten af den private øvelseskørsel.

The Relationship between Road Design and Driving Behavior
Speed is a substantial factor contributing to road safety. Currently, speed reduction is mainly achieved through law enforcement and the implementation of traffic calming measures. An alternative speed reducing approach is to encourage drivers to voluntarily choose an appropriate driving speed. Improving road infrastructure safety can be achieved by making roads forgiving and self-explaining. This could be done by clarifying the road design characteristics for each road category. The effect on driver behavior by varying road-shoulders and presence of roadside trees was tested by means of a fixed-driving simulator experiment. Speed and lateral position were used as performance indicators. The results indicated that shoulders might not be applied to decrease the speed on the experimental road stretch, but their presence cause drivers to drive closer to the road edge, hence eliminating the probability of head-on collisions. Roadside trees did not cause drivers to adjust their driving speed; possibly due to trees not being perceived as a threat to safety by the drivers. Due to a relatively small sample size the findings of this study should be considered provisional and as pilot results for further simulator experiments using larger sample sizes to visualize the impact of different road designs on the driving behavior prior to costly deployment. However, the results are highly relevant for the understanding of the influence of road design features on driver behavior as well as for the understanding of the use of the simulator in this field of road safety research.

**An explorative study of the relationship between lifestyle and driving behaviour among young drivers**
The high accident risk among young drivers is a well-known and well-documented fact in most countries, including Denmark. Lifestyle has proven to be related to driving behaviour as well as accident risk among young drivers. However, the underlying process through which the relationship between the lifestyle and the driving behaviour is established is not yet fully understood. Using focus group interviews divided by sex and education this study explores the psychosocial function of driving as well as the process through which a relationship between lifestyle and driving behaviour is established. Twenty-nine young drivers living in the Copenhagen area participated in the study. Data were analysed using a modified version of the Editing Analysis Style. (C) 2004 Elsevier Ltd. **IMPROSA: Improving Road Safety: Developing a Basis for Socio-economic Prioritising of Road Safety Measures**  
The aim of this project is to develop an improved basis for efficient socio-economic prioritising of road safety measures. Road fatalities and injuries are together with congestion the largest externalities connected to transport. The traditional way of predicting road accidents – and thus assessing road safety measures – has been to model accidents as a function of road type and traffic volume only. However, these variables cannot alone explain the trend in accidents over time and moreover, in traditional models the severity and accidents are completely decoupled. This project will overcome these shortcomings and combine the modelling approach with in-depth insight into road user behaviour. This project will use the aggregate and disaggregate parts of the so-called DRAG modelling approach to establish quantitative relations between accidents of various degrees of severity and road user (risk) behaviour, vehicle ownership, infrastructure and economic activity. Moreover, the project will estimate preference-based economic values of road safety measures. As a novelty, accident modelling will include both police recorded accidents and emergency room recorded accidents. In addition, modelling will include individual socio-economic and demographic data from the entire Danish population. Finally, a more qualified inclusion of human behaviour factors, i.e. road user sub group behaviour, in the models will be possible.
Methods range from in-depth interviews to statistical modelling. The project is organised in five work packages (WPs), each with defined tasks and scope. Thus, data for WP3 will be documented and provided by WP1 and 2; modelling will take place in WP3, qualification of the models in WP2, development of a scientifically founded valuation method of accidents in WP4, and eventually transforming results into recommendations in WP5.
