A new automated system for combined luminescence and exo-electron measurements -
DTU Orbit (26/02/2019)

A new automated system for combined luminescence and exo-electron measurements
The measurement of OSL/TL relies on the initial trapping and subsequent release and recombination of charge in a
suitable crystal structure. These measurements allow us to estimate the dose which the crystal has been subjected to and
its age. During such processes, however, electrons can be emitted from the sample surface; the ability to measure such
exo-electrons can provide information regarding the trapping process, as well as an alternative method of measuring
trapped charge. Ideally, TL/OSL can be measured alongside exo-electrons. We will present a new design for an exo-
electron detector compatible with the classic Risø reader stimulation head featuring multiple anode configurations and the
option for high-voltage modulation to reduce the UV component during TL/OSL measurements.

General information
State: Published
Organisations: Center for Nuclear Technologies, Radiation Physics, Aarhus University
Contributors: Autzen, M., Poolton, N. R. J., Murray, A. S., Kook, M., Buylaert, J.
Pages: 90-99
Publication date: 2019
Peer-reviewed: Yes

Publication information
Journal: Nuclear Inst. and Methods in Physics Research, B
Volume: 443
ISSN (Print): 0168-583X
