Chain formation of metal atoms

The possibility of formation of single-atomic chains by manipulation of nanocontacts is studied for a selection of metals (Ni, Pd, Pt, Cu, Ag, Au). Molecular dynamics simulations show that the tendency for chain formation is strongest for Au and Pt. Density functional theory calculations indicate that the metals which form chains exhibit pronounced many-atom interactions with strong bonding in low coordinated systems.

General information
State: Published
Organisations: Department of Physics, Theoretical Atomic-scale Physics
Contributors: Bahn, S. R., Jacobsen, K. W.
Pages: 266101
Publication date: 2001
Peer-reviewed: Yes

Publication information
Journal: Physical Review Letters
