CRISPR/Cas9-based genome editing has been one of the major achievements of molecular biology, allowing the targeted engineering of a wide range of genomes. The system originally evolved in prokaryotes as an adaptive immune system against bacteriophage infections. It now sees widespread application in genome engineering workflows, especially using the *Streptococcus pyogenes* endonuclease Cas9. To utilize Cas9, so-called single guide RNAs (sgRNAs) need to be designed for each target gene. While there are many tools available to design sgRNAs for the popular model organisms, only few tools that allow designing sgRNAs for non-model organisms exist. Here, we present CRISPy-web (http://crispy.secondarymetabolites.org/), an easy to use web tool based on CRISPy to design sgRNAs for any user-provided microbial genome. CRISPy-web allows researchers to interactively select a region of their genome of interest to scan for possible sgRNAs. After checks for potential off-target matches, the resulting sgRNA sequences are displayed graphically and can be exported to text files. All steps and information are accessible from a web browser without the requirement to install and use command line scripts.

**General information**
State: Published
Organisations: Novo Nordisk Foundation Center for Biosustainability, New Bioactive Compounds, iLoop
Number of pages: 4
Pages: 118-121
Publication date: 2016
Peer-reviewed: Yes

**Publication information**
Journal: Synthetic and Systems Biotechnology
Volume: 1
Issue number: 2
ISSN (Print): 2405-805x
Ratings:
Scopus rating (2017): SJR 0.841 SNIP 0.254
Original language: English
Keywords: CRISPR, Cas9, sgRNA, Guide RNA, Genome editing, Genome engineering
Electronic versions:
CRISPy_web.pdf
DOIs:
