Design of enzymatic cascade processes for the production of low-priced chemicals

While the application of enzymes to synthetic and industrial problems continues to grow, the major development today is focused on multi-enzymatic cascades. Such systems are particularly attractive, because many commercially available enzymes operate under relatively similar operating conditions. This opens the possibility of one-pot operation with multiple enzymes in a single reactor. In this paper the concept of modules is introduced whereby groups of enzymes are combined in modules, each operating in a single reactor, but with the option of various operating strategies to avoid any complications of nonproductive interactions between the enzymes, substrates or products in a given reactor. In this paper the selection of modules is illustrated using the synthesis of the bulk chemical, gluconic acid, from lignocellulosic waste.

General information
State: Accepted/In press
Organisations: PROSYS - Process and Systems Engineering Centre, KT Consortium, Department of Chemical and Biochemical Engineering, Universidad Nacional de Colombia
Contributors: Ruales-Salcedo, A. V., Higuita, J. C., Fontalvo, J., Woodley, J. M.
Publication date: 2019
Peer-reviewed: Yes

Publication information
Journal: Zeitschrift fuer Naturforschung. Section C: A Journal of Biosciences
ISSN (Print): 0939-5075
Ratings:
