Manganese-Catalyzed Cross-Coupling of Aryl Halides and Grignard Reagents by a Radical Mechanism - DTU Orbit (19/03/2018)

**Manganese-Catalyzed Cross-Coupling of Aryl Halides and Grignard Reagents by a Radical Mechanism**

The substrate scope and the mechanism have been investigated for the MnCl₂-catalyzed cross-coupling reaction between aryl halides and Grignard reagents. The transformation proceeds rapidly and in good yield when the aryl halide component is an aryl chloride containing a cyano or an ester group in the para position or a cyano group in the ortho position. A range of other substituents gave no conversion of the aryl halide or led to the formation of side products. A broader scope was observed for the Grignard reagents, where a variety of alkyl- and arylmagnesium chlorides participated in the coupling. Two radical-clock experiments were carried out, and in both cases an intermediate aryl radical was successfully trapped. The cross-coupling reaction is therefore believed to proceed by an $\text{SRN}_1$ mechanism, with a triorganomanganate complex serving as the most likely nucleophile and single-electron donor. Other mechanistic scenarios were excluded based on the substrate scope of the aryl halide.

**General information**

State: Published
Organisations: Department of Chemistry, Organic Chemistry, Risø National Laboratory for Sustainable Energy, University of Gothenburg
Authors: Antonacci, G. (Intern), Ahlburg, A. (Intern), Fristrup, P. (Intern), Norrby, P. (Ekstern), Madsen, R. (Intern)
Pages: 4758-4764
Publication date: 2017
Main Research Area: Technical/natural sciences
