Metabolic engineering of yeast for fermentative production of flavonoids - DTU Orbit

Metabolic engineering of yeast for fermentative production of flavonoids
Yeast Saccharomyces cerevisiae was engineered for de novo production of six different flavonoids (naringenin, liquiritigenin, kaempferol, resokaempferol, quercetin, and fisetin) directly from glucose, without supplementation of expensive intermediates. This required reconstruction of long biosynthetic pathways, comprising up to eight heterologous genes from plants. The obtained titers of kaempferol 26.57±2.66mgL⁻¹ and quercetin 20.38±2.57mgL⁻¹ exceed the previously reported titers in yeast. This is also the first report of de novo biosynthesis of resokaempferol and fisetin in yeast. The work demonstrates the potential of flavonoid-producing yeast cell factories.

General information
State: Published
Organisations: Novo Nordisk Foundation Center for Biosustainability, Yeast Cell Factories, Research Groups, iLoop, Department of Biotechnology and Biomedicine, Natural Product Discovery, Yeast Metabolic Engineering
Pages: 1645-1654
Publication date: 2017
Peer-reviewed: Yes

Publication information
Journal: Bioresource Technology
Volume: 245
Issue number: Part B
ISSN (Print): 0960-8524
