Protein Sorting Prediction

Many computational methods are available for predicting protein sorting in bacteria. When comparing them, it is important to know that they can be grouped into three fundamentally different approaches: signal-based, global-property-based and homology-based prediction. In this chapter, the strengths and drawbacks of each of these approaches is described through many examples of methods that predict secretion, integration into membranes, or subcellular locations in general. The aim of this chapter is to provide a user-level introduction to the field with a minimum of computational theory.

General information
State: Published
Organisations: Department of Biotechnology and Biomedicine, Department of Bio and Health Informatics, Disease Intelligence and Molecular Evolution
Contributors: Nielsen, H.
Number of pages: 35
Pages: 23-57
Publication date: 2017

Host publication information
Title of host publication: Bacterial Protein Secretion Systems: Methods and Protocols
Volume: 1615
Publisher: Springer
(Key Methods in Molecular Biology).
Keywords: Machine learning, Prediction, Protein sorting, Secretion, Subcellular location, Transmembrane proteins
DOIs:
10.1007/978-1-4939-7033-9_2
