Pupillary measurement during an assembly task - DTU Orbit (23/11/2018)

Pupillary measurement during an assembly task
We conducted an empirical study of 57 children using a printed Booklet and a digital Tablet instruction for LEGO® construction while they wore a head-mounted gaze tracker. Booklets caused a particularly strong pupil dilation when encountered as the first media. Subjective responses confirmed the booklet to be more difficult to use. The children who were least productive and asked for assistance more often had a significantly different pupil pattern than the rest. Our findings suggest that it is possible to collect pupil size data in unconstrained work scenarios, providing insight to task effort and difficulties.

General information
State: Published
Organisations: Department of Applied Mathematics and Computer Science, Cognitive Systems, Department of Management Engineering, Technology and Innovation Management, Malmö University
Contributors: Bækgaard, P., Jalaliniya, S., Hansen, J. P.
Pages: 99-107
Publication date: 1 Feb 2019
Peer-reviewed: Yes

Publication information
Journal: Applied Ergonomics
