The Smart-Energy Operating-System (SE-OS) framework has been developed within the CITIES research project (www.smart-cities-centre.org). This framework enables a systematic approach for implementing flexible electric energy systems in smart cities. The SE-OS methodologies are based on methods for data analytics, cyber physical modelling, forecasting, control, optimization, IoT, IoS, and cloud computing. The SE-OS concept has been used for enabling flexibility and demand response in smart cities in a large number of demo project. Finally it is shown that SE-OS in combination with methods for energy systems (gas, thermal, power, biomass, fuel) integration can provide virtual energy storage solutions on all relevant time scales, i.e. from minutes to seasonal storage.

The Smart-Energy Operating-System (SE-OS) is used to develop, implement and test of solutions (layers: data, models, optimization, control, communication) for operating flexible electrical energy systems at all scales.

General information
State: Published
Organisations: Department of Applied Mathematics and Computer Science, Dynamical Systems
Contributors: Madsen, H., Parvizi, J., Bacher, P.
Number of pages: 1
Publication date: 2016
Peer-reviewed: Yes
