Spatial Analysis Methods of Road Traffic Collisions - DTU Orbit (13/01/2019)

Spatial Analysis Methods of Road Traffic Collisions centers on the geographical nature of road crashes, and uses spatial methods to provide a greater understanding of the patterns and processes that cause them. Written by internationally known experts in the field of transport geography, the book outlines the key issues in identifying hazardous road locations (HRLs), considers current approaches used for reducing and preventing road traffic collisions, and outlines a strategy for improved road safety. The book covers spatial accuracy, validation, and other statistical issues, as well as link-attribute and event-based approaches, cluster identification, and risk exposure.

General information
State: Published
Organisations: Department of Management Engineering, Systems Analysis, DTU Climate Centre, University of Hong Kong
Contributors: Loo, B. P. Y., Anderson, T. K.
Number of pages: 322
Publication date: 2016

Publication information
Publisher: CRC Press
ISBN (Print): 978-1-4398-7412-7
ISBN (Electronic): 978-1-4398-7413-4
Original language: English
Research output: Research - peer-review › Book – Annual report year: 2016
