Two-dimensional metal dichalcogenides and oxides for hydrogen evolution - DTU Orbit (02/04/2019)

**Two-dimensional metal dichalcogenides and oxides for hydrogen evolution: A computational screening approach**

We explore the possibilities of hydrogen evolution by basal planes of 2D metal dichalcogenides and oxides in the 2H and 1T class of structures using the hydrogen binding energy as a computational activity descriptor. For some groups of systems like the Ti, Zr, and Hf dichalcogenides the hydrogen bonding to the 2H structure is stronger than that to the 1T structure, while for the Cr, Mo, and W dichalcogenides the behavior is opposite. This is rationalized by investigating shifts in the chalcogenide p levels comparing the two structures. We find that usually for a given material only at most one of the two phases will be active for the hydrogen evolution reaction; however, in most cases the two phases are very close in formation energy, opening up the possibility for stabilizing the active phase. The study points to many new possible 2D HER materials beyond the few that are already known.

**General information**
State: Published
Organisations: Center for Atomic-scale Materials Design, Department of Physics, Center for Nanostructured Graphene, SLAC National Accelerator Laboratory
Contributors: Pandey, M., Vojvodic, A., Thygesen, K. S., Jacobsen, K. W.
Number of pages: 59
Pages: 1527-1585
Publication date: 2015
Peer-reviewed: Yes
