The discovery of two-dimensional electron gases (2DEGs) in SrTiO$_3$-based heterostructures provides new opportunities for nanoelectronics$^{1,2}$. Herein, we create a new type of oxide 2DEG by the epitaxial-strain-induced polarization at an otherwise nonpolar perovskite-type interface of CaZrO$_3$/SrTiO$_3$.$^{3,4}$ Remarkably, this heterointerface is atomically sharp, and exhibits a high electron mobility exceeding 60,000 cm$^2$V$^{-1}$s$^{-1}$ at low temperatures. The 2DEG carrier density exhibits a critical dependence on the film thickness, in good agreement with the polarization induced 2DEG scheme.

Figure 1. Atomically-flat epitaxially grown perovskite-type interface of CaZrO$_3$/SrTiO$_3$ determined by STEM-EELS.
