Congenital Toxoplasmosis

Congenital toxoplasmosis (CT) is a parasitic disease caused by infection with Toxoplasma gondii, which is transmitted from mother to fetus.

CT can cause severe fetal and neonatal health problems or even child’s death.

The most significant symptoms of CT are included in this study:
- fetal loss;
- chorioretinitis;
- intracranial calcifications;
- hydrocephalus;
- abnormalities of the central nervous system;
- neonatal death.

Burden of Disease

Morbidity - Years Lived with Disability (YLDs):

YLD = Number of cases * duration till remission or death * disability weight

Mortality - Years of Life Lost (YLLs) due to premature mortality:

YLL = Number of deaths * life expectancy at the age of death

Burden of Disease - Disability-Adjusted Life Years (DALYs) are used as a public health measure:

DALYs = YLDs + YLLs

Morbidity & Mortality

Data from comprehensive public health surveillance and official statistics were used to estimate cases and deaths in Denmark in 2017.

Morbidity – chorioretinitis, intracranial calcifications, hydrocephalus, CNS abnormalities

Mortality – fetal loss, neonatal death

Total Burden of Disease of Congenital Toxoplasmosis

Foodborne Disease Ranking

Ranking of DALY estimates in Denmark in 2017:
1. campylobacteriosis;
2. norovirus infection;
3. salmonellosis;
4. listeriosis;
5. congenital toxoplasmosis;
6. Shiga-toxin producing E. coli (STEC) infection;
7. yersiniosis.
