Spectroscopy in high-temperature industrial processes on Earth

Senior Scientists Alexander Fateev

DTU Chemical Engineering
Department of Chemical and Biochemical Engineering
Spectroscopy in industrial processes | Outline

- Background
- Large scale measurements
- Example/Case 1: NH3
- Example/Case 2: SO2/SO3
- Example/Case 3/UV: C6H6O and C10H8
- Conclusions
Needs | **Large Scale Measurements**

- Boilers,
- Flames (oil, gas, bio-masses),
- Engines (ships, jets),
- Field campaigns (explosions)

**VIS** image grade flame (waste)

**IR** image wood dust flame (video fuel mixing)

DTU Chemical Engineering
Department of Chemical and Biochemical Engineering
**Complexity:**
- get results first
- trustful system
- 1500C is not uncommon

**Expensive:**
- access possibilities
- man power
- time

**Campaign at Blok 7 Fynsværket (Denmark)**

**DTU Chemical Engineering**
Department of Chemical and Biochemical Engineering
Data analysis:
• on-line
• at home

Source of reference data:
• measurements in a cell with pre-mixed gases
• databases (IR/UV)

NO measurements in exhaust duct of a large ship engine
Example 1 | NH3: experiment (500C, 0.09cm-1) vs calculations (BYTe)

Can we use BYTe at 500C for practical apps?

- in general a good agreement
- some difficulties with strong line intensities
- some frequency shifts in line positions

More work to do at even higher T (>500C)

More details:
Emma J. Barton et al
“High-resolution absorption measurements of NH3 at high temperatures: 500 - 2100 cm-1”
(submitted to JQSRT)
Application case 1 | In Situ measurements on Pyroneer (6MW) gasifier

NH3: Q: Why to do measurements? A: NH3 contributes to NOx formation

Gas extraction (150C):

20-06-2014 (17:00-19:30) : NH3=(0.4 ± 0.02)%, H2O=(35 ± 0.6)%, CO2=(14 ± 0.45)%, CO=(10 ± 0.21)%

24-06-2014 (15:00-17:00) : NH3=(0.42 ± 0.02)% , H2O=(36 ± 0.6)% , CO2=(13.5 ± 0.45)% , CO=(10.3 ± 0.21)%

In situ (547C):

24-06-2014 (20:00-21:00) : NH3=(0.55 ± 0.05)% , H2O=(36 ± 1)%
Application case 2 | **SO2/SO3/NH3 in a hot flue gas**

**SO2/SO3/NH3:** Q: Why to do measurements?  
A: NOx reduction at SCR/NSCR units, NH3 slip/costs, corrosion/fouling

---

**DTU Chemical Engineering**  
Department of Chemical and Biochemical Engineering
Example 2 | **SO3: measurements at 25C and 400C**

**Good news:**
- Excellent agreement with PNNL data at 25C
- No need to use high-resolution at high T
- Simple to generate, but difficult to measure/quantify
- No databases (SO2/SO3) are available at T>100C
Example 2 | SO2/SO3 cross sections (0.5cm⁻¹)

PhD (Dan Underwood) with UCL:
- SO₂ and SO₃ line lists
- ready by the end 2015
- 2nd Power plant measurement campaign, fall 2015
Example 3/UV | Phenol/Naphthalene UV absorption cross-sections temperature effects

- Not too many reference data available even at low T (about 23°C)
- An excellent agreement with published data at low T
- Significant changes in the fine structure of the cross-section spectra with T

Naphthalene abs cross-sections: from 23°C to 500°C

Phenol abs cross-sections: from 23°C to 500°C
Application case 3/UV  |  In Situ measurements on LT-CFB (100kW) gasifier

Phenol/Naphthalene:  Q: Why to do measurements?
A: Phenol/Naphthalene – major trace gases from PAH’s in low temperature gasification

Few new challenges:

- Very strong UV light attenuation
- Very broad continuum-like abs structures
- Very small L for in situ measurements

DOAS approach: SO2 UV absorption as an example
**Application case 3/UV** | In Situ measurements on LT-CFB (100kW) gasifier

## Comparison of the measurements

Conclusions | Now

In general
• You can find a lot inspirations for the work on the Earth
• Different research areas can have the same origin
• Scientists can make industry guys happy

In particular:
  o Excellent experimental tools are available for (VUV) UV-FIR optical measurements
  o Temperature range can be also negative (e.g. gases at low T)
  o New data/lines for NH₃/SO₂/SO₃
  o New data for phenol/naphthalene
  o Try always In Situ and avoid any Ex Situ (extraction) measurements
Conclusions | Future

- Inspiration comes from industry (small, middle large, ...)
- Possible spin offs: innovation (patents)
- New gas components: CH₃Cl, KCl etc. (together with UCL)
- Combine several methods to obtain multi-parameters
- ...
