**Background**

*Mycoplasma (M.) bovis* causes in cattle, among other diseases, mastitis. The dairy cattle population in Denmark had an increase in atypical clinical outbreaks of *M. bovis* over the past years. An important prerequisite to the implementation of an effective control program is to determine the geographical distribution of *M. bovis*.

**Conclusions**

• *Mycoplasma bovis* infected herds are clustered in northern or southern Denmark.

**Results**

Space-time scan statistics (SatScan™) / K-function

Significant local primary clusters*

The maps show the location of the clusters of *M. bovis* infected herds, while the inserts (K-function) indicate global clustering of cases around a radius of 70 km (app), in each round.

(*) There was no clustering in the second round.

**Data**

2013

- First round
- Second round
- Third round
- Fourth round

2014

- First round
- Second round
- Third round
- Fourth round

The clusters are in areas with high herd and cattle density.

**Acknowledgements:**

- Danish Milk Levy fund who funded the sampling
- SEGES who provided the data
