Feasible Working Domains – Decision Support for Heat Pump Projects

4th International Symposium on Advances in Refrigeration and Heat Pump Technology
November 19th 2015

Torben Ommen
Section of Thermal Energy, Technical University of Denmark
Motivation

Potential for energy and economic optimisation in industrial plants and district heating systems by using large scale heat pumps.

- Complex systems: economic optimum depends on both heat pump performance, investment, expected operation hours, taxation and fuel cost.
- Pinch- or plant optimisation specialists are not necessarily experts on best available heat pump technology, and may thus be assisted by decision support tools.
Motivation

Potential for energy and economic optimisation in industrial plants and district heating systems by using large scale heat pumps.

- Complex systems: economic optimum depends on both heat pump performance, investment, expected operation hours, taxation and fuel cost.
- Pinch- or plant optimisation specialists are not necessarily experts on best available heat pump technology, and may thus be assisted by decision support tools.

Working domains

- Introduced in "Comparison of the working domains of some compression heat pumps and a compression-absorption heat pump" by Brunin et al. (1997)
  - Economic feasibility integrated by including two physical constraints
  - Technical constraints are similar to operating envelope for individual components

- Technical and economical working domains for single stage industrial heat pumps.
  - R134a, R290, R600a, R717-LP, R717-HP and R744 in Ommen et al. (2015a)
  - Ammonia-water hybrid absorption compression HP in Jensen et al. (2015)
  - R600a and R717-HP in series in Ommen et al. (2015b)
Working domains in literature

(a) Example of working domain with VHC and COP to represent economic feasibility (Brunin et al., 1997)

(b) Example of working domain with economic and technical constraints (Ommen et al., 2015a).

Method

Economic assumptions

- Heat pump load: 1000 (kW)
- Operating time 3500 (h/year)
- Lifetime 15 (years)
- Natural gas burner efficiency 0.9 (-)
- Interest rate of 7 (%) 
- Inflation rate of 2 (%) 

- NPV and PBT based on gas boiler replacement
- Component investment cost based on Danish prices
- Danish electricity and gas prices were used
- Natural gas burner investment and O&M not considered

Correlations for component cost of the type:

$$ PEC_Y = PEC_W \left( \frac{X_Y}{X_W} \right)^\alpha $$

- **Discussion**
Further steps

Two economic cases (industrial and DH)

(a) $\Delta T_{\text{sink}} / \Delta T_{\text{source}} = 20 \text{ K} / 20 \text{ K}$

(b) $\Delta T_{\text{sink}} / \Delta T_{\text{source}} = 40 \text{ K} / 10 \text{ K}$
Further steps

Two stage HP configurations

- Individual models for each component
  - A high amount of configurations possible.
  - Generic solutions to optimal configurations are needed.
  - High amount of free variables, eg. oil integration only constrained to intervals.

(a) Heat exchangers not fixed connection to heat sink
Further steps

HP configurations in series

(a) Possibilities for creating various two stage HP cycle layouts
Discussion

• Discussion
Important findings from analysis

The analysis of working domains shows, that sink temperatures of up to 120 - 140 °C and temperature lifts 40 - 60 K may be obtained using VCHP and HACHP technologies.

- The NPV is favourable for the technologies utilising R717, but a technical constraint (the discharge temperature) limited the applicability in terms of temperature lift.
- Serial connection of VCHP increases the COP, but at decreased NPV. If more than one heat pump is needed due to capacity constraints, the increase in COP from serial connection of the considered units should be included.
- VCHP in series increases the working domain of current technical and economic constraints. Either due to reduction in resulting discharge temperature of compressor or mixed working fluids selection to obtain combination of certain characteristics.

Further work and analysis is required to obtain generic tool, as a high amount of configurations are possible.

- Input are welcome for other HP configurations, changed temperature sets or economic cases.
