DTU Wind Energy
A robust, efficient, easy to use and flexible tool created to facilitate the optimised design of individual and clusters of offshore wind farms.
Streamlining project planning of offshore wind farms

Even though offshore wind farms are incredibly expensive—and a great deal of time is devoted to planning them—communication between project developers leaves a lot to be desired. Simply put: one expert often has little idea what another is doing, and this costs a lot of time and money. However, this situation may soon be history thanks to a new tool developed by DTU Wind Energy in Roskilde.

http://www.dtu.dk/english/News/2015/04/Offshore-wind-farms-to-be-developed-with-a-single-model?id=c3435bfd-ef12-42cf-8f39-fd5fa8e948c8
EERA DTOC main components

• Use and bring together existing models from the partners
• Develop open interfaces between them
• Implement a shell to integrate
• Fine-tune the wake models using dedicated measurements
• Validate final tool
Concept and implementation

- Meteorological data / Cluster layout / Turbine data
- Grid data
- Wake models
- Grid models
- Yield models

**DTOC Tool**
- GIS
- LCOE
- uncertainty
- FUGA
- WAsP
- WRF
- WRF/ROMS
- CorWind

**DTOC Services**
- eefarm
- FarmFlow
- WCMS
- Net-op
- SKIRON
- VENTOS
Validation of wake models

SCADA data at Horns Rev 1, Lillgrund and Rødsand 2 offshore wind farms have been compared to more than 10 wake models.

SCADA data and lidar data at Alpha ventus have been compared to three wake models.

Satellite data have been compared to four wake models.

Main conclusion

The benchmark concludes that several models were able to handle the clustering of wind farms.
## Participants and park models

**BA=Bin Averaged & GU=Gaussian Uncertainty**
Rødsand-2 wind farm cluster effect

Offshore wind farm cluster: Rødsand II & Nysted

Model inflow
$U_{hub} = 8 \text{ m/s}$
$WDIR = 97^\circ$
Cluster effect for \( U=8 \text{ m/s}; \ WD=97^\circ \)
Rødsand-2 park efficiency @ 77-118°
• Quantification of the cluster effect is not possible due to lack of measurements and park asymmetries.
• The benchmark has demonstrated that both size and location of the distinct deficit zone - caused by the Nysted wind farm has been predicted quite well by the models.
• The benchmark concludes that several models were able to handle the clustering of wind farms.
EWP scheme applies a grid-cell averaged deceleration to the model's flow equation and additional turbulence is produced by the PBL scheme from the changed vertical shear in horizontal velocity.

DTOC tool
and commercialisation
Avoid re-inventing the wheel...

- Coupling to GIS software for editing of locations and properties
- Consideration of limitations and other exploitation by GIS approach

- Integrate existing models seamlessly:
  - WRF (meteorology, wind climate)
  - WAsP
  - FUGA (wind farm effects)
  - FarmFlow (wind farm effects)
  - LCOE
• As a developer I can **determine the optimum** spacing, position, turbine model and hub height of turbines within an offshore wind farm.

*Software supports the **comparison** of many design scenarios.*

*Comparative reporting enables selection of optimised configurations.*

**Score for comparison: Levelised Cost of Energy**
1. Generate Design Options
   - Scenario 1
   - Scenario 2
   - Scenario 3
   - Scenario 4
   - Scenario 5
   - Scenario 6
   - Scenario 7

2. Evaluate Design Options
   - Wake Model
   - Electrical Model
   - Energy model

3. Compare Design Options

4. Iterate steps 1 to 3

Score: Levelized cost of energy

What decision parameter can we use to compare design options?
Commercial tool: Wind & Economy
System overview
Local computer: GIS and local web browser
Welcome to Wind & Economy

One of the most challenging tasks for wind farm developers is the optimisation of offshore wind power plants. Our new software tool, Wind & Economy, supports your challenging work with the seamlessly integrated modelling of wind climate, large scale and localized wind farm effects, electrical loss calculations and derivation of economic key figures.

http://wind-and-economy.com/home/
Wind & Economoy: The tool for wind farm optimization

- wind climate
- turbine type selection
- turbine spacing and placing

- interaction between wind farms in clusters with respect to energy production

- LCOE and economic uncertainty

- Scenario approach
- GIS integration

Bringing leading edge modelling to your desktop
Wind&Economy Demo
Conclusion

The main project output, the ‘Wind & Economy’ software, provides a new frame for planning offshore wind farm clusters.

By seamless integration of state-of-the-art models from the scientific development by the EERA members, which have been compared and validated by the research community and end-users, provides a significant potential for cost reductions.

The rapid development of offshore wind farms in the Northern European Seas with major clusters planned in many countries makes the release of this novel tool available with due diligence.
We aim at developing the tool for strategic planners

1) Add environmental aspects and restricted zones
2) Add sea bed and estimate foundation costs
3) Improved cost of energy and O&M module
4) Further detail wind farm cluster effects
5) Include social acceptance

DTU has submitted EUDP2015 proposal (Danish national activity).
A robust, efficient, easy to use and flexible tool created to facilitate the optimised design of individual and clusters of offshore wind farms.

What is EERA-DTOC?

EERA-DTOC stands for the European Energy Research Alliance - Design Tool for Offshore Wind Farm Cluster.

The project is funded by the EU – Seventh Framework Programme (FP7) – and runs from January 2012 to June 2015. It is coordinated by the Technical University of Denmark - DTU Wind Energy.

- New: Final Summary Report available now!
- New: software tool (Wind & Economy) available now!
- Consult the presentations with results from EERA-DTOC
