PURPOSE
To prepare cubosomes carrying the model antigen ovalbumin and the adjuvant Quil A using spray drying as method, as well as to in vitro characterize these particles.

METHOD

**RESULTS**

**Particle Morphology**

The spray dried powder was heated to 90°C for 24h. This reduced electrostatic charges in the powder, allowed easy reconstitution to a colloidally stable suspension, and induced weight loss of 8%. The powder was rich in cubosomes after reconstitution (Fig. 2).

**Particle Characterization**

Table 1: Size and zeta-potential of cubosomes with and without adjuvant as measured by dynamic light scattering in Milli-Q water. Mass median aerodynamic diameter (MMAD) measured by time-of-flight mass spectroscopy.

**ACKNOWLEDGEMENTS**

The research is funded by the Danish National Research Foundation (DNRF122) and Villum Fonden (Grant No. 9301). We acknowledge the Core Facility for Integrated Microscopy, Faculty of Health and Medical Sciences, University of Copenhagen.

**CONCLUSION**

The developed cubosomes show properties suitable to be used for oral vaccine delivery in microcontainers.
