Offshore Wind Energy Conference, 6-8 June 2017, London, UK
Anholt offshore wind farm

Number of turbines: 111  
Wind turbine capacity: 3.6 MW  
Rotor diameter: 120 meters  

Construction period: 2012-2013  

SCADA data for analysis is from January 1st, 2013 to June 30, 2015 (2.5 years)  

Courtesy: DONG Energy
Research question

How well can we quantify the wake effect from modelling and satellite?

Sub-task:

How large is the coastal wind speed gradient?
Data

• Supervisory control and data acquisition (SCADA)
• Satellite Synthetic Aperture Radar (SAR)
• Weather Research and Forecasting model (WRF)
• Reynolds-averaged Navier-Stoke model (RANS)
Location

Conclusions

There is significant wind speed gradient at Anholt offshore wind farm in particular for westerly flow.

SCADA, WRF, RANS and SAR confirm the wind speed gradient.

Wind farm wake from RANS and SCADA for specific wind speed and direction compare well.

Satellite SAR analysis indicate far-field wind farm wake.
