December 2018

DTU Nutech
Center for Nuclear Technologies
Abstract (max. 2000 char.): The environmental surveillance of the Risø environment was continued in January-June 2018. The mean concentrations in air were: 0.37±0.27 μBq m⁻³ of ¹³⁷Cs, 4.00±1.59 mBq m⁻³ of ⁷Be and 0.37±0.26 mBq m⁻³ of ²¹⁰Pb (±1 S.D.). The depositions by precipitation at Risø in the first half of 2018 were: 0.045±0.007 Bq m⁻² of ¹³⁷Cs, 316±32 Bq m⁻² of ⁷Be, 28.4±2.6 Bq m⁻² of ²¹⁰Pb and <0.9 kBq m⁻² of ³H. The average background dose rate (TLD) at Risø (Zone I) was measured as 59 nSv h⁻¹ compared with 55 ± 3 nSv h⁻¹ (±1 S.D.) in the four zones around Risø.

Conclusions 25
INTRODUCTION

A specific monitoring programme in the vicinity of the nuclear installations at the Risø site is carried out by DTU Nutech on behalf of and as a contractor to Danish Decommissioning (DD). This report presents the analytical results of the monitoring and sampling carried out in the period January-June 2018. The materials and methods used in connection with the monitoring programme are described in pages 23-24.

*Figures in brackets are relative standard uncertainties

* Increased concentrations possibly caused by forest fires in areas of Eastern Europe contaminated from the Chernobyl accident. Increased values also recorded at this time by FOI, Sweden, in Gotland.

MATERIALS AND METHODS

External gamma dose rate monitoring
Monitoring of external gamma dose rate is carried out with the following devices

- Thermoluminescence dosimeters TLD: LiF, measurement frequency annually from May to April. TLD equipment manufacturer: ALNOR/RADOS
- NaI detector: 3x3 inch, SAM 935 Surveillance and Measurement System, Berkeley Nucleonics Cooperation, USA, visual read-out

Calibration of TLD is carried out by irradiation of dosimeters at a calibration irradiator. Traceability of delivered doses is ensured through calibration of the dose rate of the calibration irradiator by the National Institute of Radiation Protection (SIS). Calibration has been verified by measurement with ionisation chamber from NPL, UK. The NaI detector is calibrated periodically vs. a Reuter Stokes high-pressure ionisation chamber.

Air sampler
The sampler at Risø is manufactured by DTU. Air is drawn through a polypropylene filter at a rate of about 2000 m$^3$/h. The filter is normally changed weekly. The flow rate is monitored by a gas meter connected to a shunt. The gas meter reading is compared to that of a reference gas meter intermittently.

DTU analyse the filters by gamma spectrometry shortly after filter change to check for the presence of short-lived man-made radionuclides. The air filters are subsequently stored for a minimum of one week to allow for decay of short-lived naturally occurring radionuclides before repeated gamma analysis. Filters are analysed for $^{137}$Cs, $^7$Be and $^{210}$Pb and other gamma emitters.

Deposition collector
The Risø site operates a large rain collector of 10 m$^2$. The collector is heated and water is passed through an ion exchange column to a large tank. The 10 m$^2$ collector provides monthly samples of rain water analysed for tritium and ion exchange resin which is analysed by gamma spectrometry for $^7$Be, $^{137}$Cs and $^{210}$Pb and other gamma emitters.

Water and sediment
A waste water sample from the Waste Treatment Station is collected weekly and analysed for total beta radioactivity and the radionuclides $^{131}$I, $^{137}$Cs and $^{226}$Ra. Water samples from Roskilde Fjord are collected each quarter and analysed for tritium, annually for $^{137}$Cs. A sediment sample is collected annually from Roskilde Fjord and analysed for $^{137}$Cs.

Terrestrial and aquatic biota and flora
Grass samples are collected weekly at the Risø site and analysed by gamma spectrometry. Samples are bulked to monthly samples which are analysed for $^{137}$Cs.
Seaweed samples are collected annually from Roskilde Fjord at Risø and analysed for $^{137}$Cs.
Sample reception and preparation

Sample identification numbers are entered in log books. Sample preparation methods include drying, freeze drying, ashing, sorting and sieving. Selected samples are archived.

Sample measurements

Radioactivity in samples is measured by total beta counting and gamma spectrometry.

Measurement devices

- Ge detectors for gamma spectrometry. Calibration of detectors is based on mixed-nuclide standards used occasionally. Monthly checks are made of detector efficiency and energy resolution. Background measurements of gamma systems are made a few times per year.
- Low-level Geiger-Müller counters for total beta counting, manufactured by DTU. Calibration based on standards of KCl. Counting efficiency and background are checked monthly.
- Liquid scintillation spectrometer for analysis of tritium in water. Samples are analysed with a calibration standard.

Analytical results, data handling and reporting tools

Analytical results are printed on paper, recorded in log books and stored in a database on intranet. Results below detection limits recorded as such. Spreadsheets are used for calculating results from raw data.

Quality assurance, laboratory accreditation and intercomparison exercises

Analytical results are checked by experienced staff and discussed with senior scientists if questions arise.

DTU is accredited to testing for radioactivity by DANAK according to the international standard ISO 17025. The accreditation covers testing for certain non-gamma emitting radionuclides but not for radionuclides occurring in the environment and food in general.

DTU participate regularly in international intercomparisons on laboratory analyses of radionuclides.
CONCLUSIONS

This report shows the results of the environmental surveillance monitoring programme carried out at and around the Risø site in January-June 2018. The mean concentrations in air were: 0.37±0.27 μBq m⁻³ of ¹³⁷Cs, 4.00±1.59 mBq m⁻³ of ⁷Be and 0.37±0.26 mBq m⁻³ of ²¹⁰Pb (±1 S.D.). The depositions by precipitation at Risø in the first half of 2018 were: 0.045±0.007 Bq m⁻² of ¹³⁷Cs, 316±32 Bq m⁻² of ⁷Be, 28.4±2.6 Bq m⁻² of ²¹⁰Pb and <0.9 kBq m⁻² of ³H. The average background dose rate (TLD) at Risø (Zone I) was measured as 59 nSv h⁻¹ compared with 55 ± 3 nSv h⁻¹ (±1 S.D.) in the four zones around Risø. None of the recorded levels of radioactivity and radiation have given rise to concern.
Center for Nuclear Technologies is Denmark’s national competency center for nuclear technology. With roots in research in the peaceful use of nuclear power, DTU Nutech works with the applications of ionizing radiation and radioactive substances for the benefit of society.
