Significances of Pu, Np, U and Tc determination

1) Environmental risk assessment and monitoring
2) Nuclear emergency preparedness
3) Routine occupational health monitoring
4) Nuclear Forensics
5) Nuclear decommissioning and waste disposal
6) Radioecology and tracer studies
Distribution characters of Pu, Np, U and Tc in environmental and biological samples

1) Levels are very low and vary with location or sample type
2) Often coexist with matrix elements (Ca, Mg, Al, V, Ru, Mo…) and other interfering radionuclides (Th, Am, Cm…)
Traditional analytical methods for Pu and Np

Pre-concentration:
- 8-16 batchwise
- Fairly straightforward

Chemical purification:
- Lengthy
- High labor intensity
- High consumption of resin
- Organic waste

Detection:
- Long counting time
- High detection limit

Pre-concentration:
- Dry, ashing
- Acid leaching

Chemical purification:
- Valence adjustment
- Anion exchange chromatography + solvent extraction

Detection:
- Electro-deposition
- Alpha spectrometry
Our objectives

1. Rapid determination of Pu, Np, U and Tc
2. Automation of the analytical procedure

Specific focuses:

i. Chemical purification
   – Protocol simplification and optimization
   – Automation

ii. Detection
   – Mass spectrometry (ICP-MS, AMS)
Automation techniques

- Vacuum box
- HPLC
- Flow injection/Sequential injection

Final strategies

Flow/Sequential injection

Carriër  SP  HC  R1  R2  SV  E  W

Extraction or anion exchange chromatography

Eluates

ICP-MS/AMS
## Methods Development-Pu and Np

### Environmental Samples:
- 0.5-200 g of soil, sediment or seaweed
- 50-200 L of seawater

### Parameters optimized:
- Resin type (TEVA, AG1, AG MP-1M)
- Column size (1-20 mL)
- Washing solution (1-8 M HNO₃)
- Elution solution (NH₂OHCl-HCl, 0.1-1.0 M HCl)
- Flow rate (1-5 mL/min)

### Performance evaluation:
- Chemical yields; $^{237}\text{Np}/^{242}\text{Pu}$ chemical yield;
- Decontamination of U; Method reability; Sample throughput
Auto-uint no.1---Sequential injection

Automatically handle 9 samples! Work overnight!

### Selected results for soil analysis

Environmental Sample:
- 10 L of seawater

Parameters optimized:
- Resin type (TEVA, UTEVA)
- Washing solution (1-4 M HNO₃)
- Decomposition of organic matter

Performance evaluation:
Chemical yields; $^{237}\text{Np}/^{242}\text{Pu}$ chemical yield ratio;
Method reability; Sample throughput
Auto-unit no.3---Dual-column sequential injection

Flexible control the connection of two columns!

Add conc. HCl to pH=2, add tracer $^{242}\text{Pu}$; Add 0.5 g Fe and 5 g $\text{K}_2\text{S}_2\text{O}_5$; $\text{N}_2$ bubbling for 20 min.; Add 10% $\text{NH}_3\cdot\text{H}_2\text{O}$ to pH 8-9; Add 40 g NaCl, wait 0.5-1 h, discard the supernatant.

**Fe(II) hydroxide co-precipitate**

Dissolve with 40 mL aqua regia; Digest under 200 °C for 2 h; Filtrate with GF/A filter paper; Add conc. $\text{NH}_3\cdot\text{H}_2\text{O}$ to pH 8-9; Centrifuge and discard the supernatant.

**Fe(III) hydroxide co-precipitate**

Dissolve with diluted HCl; Add 500 mg $\text{K}_2\text{S}_2\text{O}_5$ stir for 20 min.; Add conc. $\text{NH}_3\cdot\text{H}_2\text{O}$ to pH 8-9; Centrifuge and discard the supernatant.

**Fe(II) hydroxide co-precipitate**

Dissolve with 1-2 mL of conc. HCl; Add conc. $\text{HNO}_3$ to the final concentration of 3 mol/L $\text{HNO}_3$.

1. Sample loading
2. Rinse with 20 mL 3 mol/L $\text{HNO}_3$
3. Rinse with 20 mL 1 mol/L $\text{HNO}_3$
4. Rinse with 20 mL 1 mol/L $\text{HNO}_3$
5. Rinse with 20 mL 6 mol/L HCl
6. Elute Pu/Np with 20 mL 0.1 mol/L $\text{NH}_2\text{OH-HCl}$; 2 mol/L HCl

7. Elute U with 20 mL 0.025 mol/L HCl

**TEVA + UTEVA** + 1+2+3 Waste

7 Eluate

4 Eluate Pu/Np

Conclusions and perspectives

Innovation of the previous work:
• Automatic
• Rapid and simple
• No need of Np isotopic tracer
• Low consumption of resins
• High sample throughput
• Low labor intensity

On-going projects:
• Tracer application studies of Pu and $^{236}\text{U}$
• Multi-radionuclide determination (Pu/Np,U, Th, Am) in environmental samples
Thank you!
