Advances in metabolic engineering of yeast Saccharomyces cerevisiae for production of chemicals

Yeast Saccharomyces cerevisiae is an important industrial host for production of enzymes, pharmaceutical and nutraceutical ingredients and recently also commodity chemicals and biofuels. Here, we review the advances in modeling and synthetic biology tools and how these tools can speed up the development of yeast cell factories. We also present an overview of metabolic engineering strategies for developing yeast strains for production of polymer monomers: lactic, succinic, and cis,cis-muconic acids. S. cerevisiae has already firmly established itself as a cell factory in industrial biotechnology and the advances in yeast strain engineering will stimulate development of novel yeast-based processes for chemicals production.

General information
Publication status: Published
Organisations: Novo Nordisk Foundation Center for Biosustainability, Research Groups, Fungal Cell Factories, Chalmers University of Technology
Contributors: Borodina, I., Nielsen, J.
Number of pages: 12
Pages: 609-620
Publication date: 2014
Peer-reviewed: Yes

Publication information
Journal: Biotechnology Journal
Volume: 9
Issue number: 5
ISSN (Print): 1860-6768
Ratings:
BFI (2014): BFI-level 1
Scopus rating (2014): CiteScore 2.98 SJR 1.189 SNIP 1.062
Web of Science (2014): Impact factor 3.49
Web of Science (2014): Indexed yes
Original language: English
Keywords: BIOCHEMICAL, BIOTECHNOLOGY, SUCCINIC ACID PRODUCTION, FLUX BALANCE ANALYSIS, PYRUVATE-DECARBOXYLASE, GENE-EXPRESSION, BUDDING YEAST, MANNHEIMA-SUCCINICIPRODUCENS, BAKERS-YEAST, GENOME, GLUCOSE, BIOSYNTHESIS, Industrial biotechnology, Metabolic engineering, Saccharomyces cerevisiae, Synthetic biology, Yeast
