Dissemination of antibiotic resistance genes from antibiotic producers to pathogens - DTU Orbit (08/11/2019)

It has been hypothesized that some antibiotic resistance genes (ARGs) found in pathogenic bacteria derive from antibiotic-producing actinobacteria. Here we provide bioinformatic and experimental evidence supporting this hypothesis. We identify genes in proteobacteria, including some pathogens, that appear to be closely related to actinobacterial ARGs known to confer resistance against clinically important antibiotics. Furthermore, we identify two potential examples of recent horizontal transfer of actinobacterial ARGs to proteobacterial pathogens. Based on this bioinformatic evidence, we propose and experimentally test a 'carry-back' mechanism for the transfer, involving conjugative transfer of a carrier sequence from proteobacteria to actinobacteria, recombination of the carrier sequence with the actinobacterial ARG, followed by natural transformation of proteobacteria with the carrier-sandwiched ARG. Our results support the existence of ancient and, possibly, recent transfers of ARGs from antibiotic-producing actinobacteria to proteobacteria, and provide evidence for a defined mechanism.

General information
Publication status: Published
Organisations: Novo Nordisk Foundation Center for Biosustainability, New Bioactive Compounds, Research Groups, Bacterial Synthetic Biology
Publication date: 2017
Peer-reviewed: Yes

Publication information
Journal: Nature Communications
Volume: 8
Article number: 15784
ISSN (Print): 2041-1723
Ratings:
BFI (2017): BFI-level 2
Scopus rating (2017): CiteScore 12.41 SJR 6.582 SNIP 2.934
Web of Science (2017): Impact factor 12.353
Web of Science (2017): Indexed yes
