Pesticides are toxic substances that are deliberately released into our environment to kill or control living organisms. They have many beneficial qualities with regards to their intended use, but also carry with them potential harmful side effects for other living organisms that are inadvertently exposed, including humans. In this article, we will discuss some of the possible toxic effects they can have on male reproductive health. Of particular concern are pesticides with endocrine disrupting properties, which have been shown to interfere with male reproductive development. Early life exposure can prevent proper masculinization, having permanent consequences for the offspring.

General information
Publication status: Published
Organisations: National Food Institute, Research group for Molecular and Reproductive Toxicology, Copenhagen Center for Health Technology
Contributors: Svingen, T., Christiansen, S., Taxvig, C., Vinggaard, A. M.
Number of pages: 5
Pages: 624-628
Publication date: 2018

Host publication information
Title of host publication: Encyclopedia of Reproduction
Volume: 1
Publisher: Academic Press
Editor: Skinner, M.
Edition: 2
ISBN (Print): 9780128118993
DOIs: 10.1016/B978-0-12-801238-3.64383-0
