Graphite nodules in fatigue-tested cast iron characterized in 2D and 3D

Graphite nodules in fatigue-tested cast iron characterized in 2D and 3D

Thick-walled ductile iron casts have been studied by applying (i) cooling rate calculations by FVM, (ii) microstructural characterization by 2D SEM and 3D X-ray tomography techniques and (iii) fatigue testing of samples drawn from components cast in sand molds and metal molds. An analysis has shown correlations between cooling rate, structure and fatigue strengths demonstrating the benefit of 3D structural characterization to identify possible causes of premature fatigue failure of ductile cast iron.

General information
Publication status: Published
Organisations: Department of Wind Energy, Materials science and characterization, Department of Applied Mathematics and Computer Science, Image Analysis & Computer Graphics, Department of Physics, Global Castings A/S, Vestas Wind Systems AS
Contributors: Mukherjee, K., Fæster, S., Hansen, N., Dahl, A. B., Gundlach, C., Frandsen, J. O., Sturlason, A.
Pages: 169-178
Publication date: 2017
Peer-reviewed: Yes
