Crystallization of Pd40Cu30Ni10P20 bulk metallic glass with and without pressure - DTU Orbit (18/08/2019)

Crystallization of Pd40Cu30Ni10P20 bulk metallic glass with and without pressure

The glass-transition behavior of Pd40Cu30Ni10P20 bulk metallic glass was investigated by differential scanning calorimetry (DSC) and X-ray powder diffraction (XRD). The effect of pressure on the crystallization behavior of Pd40Cu30Ni10P20 bulk glass was studied by in situ high-pressure and high-temperature X-ray powder diffraction using synchrotron radiation. Phase analyses show at least six crystalline phases in the crystallized sample, namely, monoclinic, tetragonal Cu3Pd-like, rhombohedral, fcc-Ni2Pd2P, fcc-(Ni, Pd) solid solution, and body-centered tetragonal (bct) Ni3P-like phases. The onset crystallization temperature increases with pressure having a slope of 11 K/GPa in the range of 0 to 4 GPa. The results are attributed to the competing process between the thermodynamic potential barrier and the diffusion activation energy under pressure.

General information
Publication status: Published
Organisations: Department of Physics
Contributors: Yang, B., Jiang, J., Zhuang, Y., Saksl, K., Chen, G.
Pages: 356-360
Publication date: 2007
Peer-reviewed: Yes

Publication information
Journal: Gongcheng Kexue Xuebao
Volume: 14
Issue number: 4
ISSN (Print): 2095-9389
Ratings:
Web of Science (2007): Indexed yes
Original language: English
Keywords: pressure, crystallization, supercooled liquid, metallic glass
DOI: 10.1016/S1005-8850(07)60070-X
