Machine Learning Techniques for Optical Performance Monitoring from Directly Detected PDM-QAM Signals - DTU Orbit (26/06/2019)

Machine Learning Techniques for Optical Performance Monitoring from Directly Detected PDM-QAM Signals

Linear signal processing algorithms are effective in dealing with linear transmission channel and linear signal detection, while the nonlinear signal processing algorithms, from the machine learning community, are effective in dealing with nonlinear transmission channel and nonlinear signal detection. In this paper, a brief overview of the various machine learning methods and their application in optical communication is presented and discussed. Moreover, supervised machine learning methods, such as neural networks and support vector machine, are experimentally demonstrated for in-band optical signal to noise ratio (OSNR) estimation and modulation format classification, respectively. The proposed methods accurately evaluate optical signals employing up to 64 quadrature amplitude modulation (QAM), at 32 Gbaud, using only directly-detected data.

General information
Publication status: Published
Organisations: Department of Photonics Engineering, Networks Technology and Service Platforms, High-Speed Optical Communication, Technical University of Denmark
Contributors: Thrane, J., Wass, J., Piels, M., Medeiros Diniz, J. C., Jones, R., Zibar, D.
Number of pages: 10
Pages: 868-875
Publication date: 2017
Peer-reviewed: Yes

Publication information
Journal: Journal of Lightwave Technology
Volume: 35
Issue number: 4
ISSN (Print): 0733-8724
Ratings:
BFI (2017): BFI-level 2
Scopus rating (2017): CiteScore 4.42 SJR 1.166 SNIP 1.791
Web of Science (2017): Indexed yes
Original language: English
Keywords: Optical Communication, Machine Learning, Performance monitoring, Neural networks, Support vector machines
Electronic versions:
Machine_Learning_Techniques.pdf
DOIs:
