Prediction of Full-Scale Propulsion Power using Artificial Neural Networks

Full scale measurements of the propulsion power, ship speed, wind speed and direction, sea and air temperature from four different loading conditions, together with hind cast data of wind and sea properties; and noon report data has been used to train an Artificial Neural Network for prediction of propulsion power. The model was optimized using a double cross validation procedure. The network was able to predict the propulsion power with accuracy between 0.8-1.7% using onboard measurement system data and 7% from manually acquired noon reports.

General information
Publication status: Published
Organisations: Coastal, Maritime and Structural Engineering, Department of Mechanical Engineering, Cognitive Systems, Department of Informatics and Mathematical Modeling
Contributors: Pedersen, B. P., Larsen, J.
Pages: 537-550
Publication date: 2009

Host publication information
Title of host publication: COMPIT '09 : 8th International Conference on Computer and IT Applications in the Maritime Industries
Place of publication: Budapest, 10-12 May 2009
Keywords: propulsion, vessel, fuel consumption, ship, performance, Artificial neural networks
URLs:
http://www.compit.info
Source: orbit
Source ID: 256294
Research output: Chapter in Book/Report/Conference proceeding › Article in proceedings – Annual report year: 2009 › Research › peer-review
