The Navigation Metaphor in Security Economics

The navigation metaphor for cybersecurity merges security architecture models and security economics. By identifying the most efficient routes for gaining access to assets from an attacker's viewpoint, an organization can optimize its defenses along these routes. The well-understood concept of navigation makes it easier to motivate and explain security investment to a wide audience, encouraging strategic security decisions.

General information
Publication status: Published
Organisations: Department of Applied Mathematics and Computer Science, Formal Methods, Delft University of Technology, LUST, Consult Hyperion, University of London, KPMG Netherlands
Contributors: Pieters, W., Barendse, J., Ford, M., Heath, C. P. R., Probst, C. W., Verbij, R.
Number of pages: 8
Pages: 14-21
Publication date: 2016
Peer-reviewed: Yes

Publication information
Volume: 14
Issue number: 3
ISSN (Print): 1540-7993
Ratings:
BFI (2016): BFI-level 1
Scopus rating (2016): CiteScore 1.39 SJR 0.347 SNIP 1.277
Web of Science (2016): Impact factor 1.382
Web of Science (2016): Indexed yes
Original language: English
Keywords: Electrical and Electronic Engineering, Computer Networks and Communications, Law, attack navigators, attacker profiles, cyberattacks, e-commerce, hackers, Internet/Web technologies, navigation, security, security economics, security models, visualization, COMPUTER, software architecture, decision making, security of data, strategic security decision, navigation metaphor, cybersecurity, security architecture model, access control, Biological system modeling, Economics, Computer security, Navigation, Electonic commerce, Web servuces, Modeling, Data security, Software engineering techniques
