The toxicity of plastic nanoparticles to green algae as influenced by surface modification, medium hardness and cellular adsorption - DTU Orbit (08/11/2019)

To investigate processes possibly underlying accumulation and ecological effects of plastic nano-particles we have characterized their interaction with the cell wall of green algae. More specifically, we have investigated the influence of particle surface functionality and water hardness (Ca2+ concentration) on particle adsorption to algae cell walls. Polystyrene nanoparticles with different functional groups (non-functionalized, −COOH and −NH2) as well as coated (starch and PEG) gold nanoparticles were applied in these studies. Depletion measurements and atomic force microscopy (AFM) showed that adsorption of neutral and positively charged plastic nanoparticles onto the cell wall of P. subcapitata was stronger than that of negatively charged plastic particles. Results indicated that binding affinity is a function of both inter-particle and particle-cell wall interactions which are in turn influenced by the medium hardness and particle concentration. Physicochemical modelling using DLVO theory was used to interpret the experimental data, using also values for interfacial surface free energies. Our study shows that material properties and medium conditions play a crucial role in the rate and state of nanoparticle bio-adsorption for green algae. The results show that the toxicity of nanoparticles can be better described and assessed by using appropriate dose metrics including material properties, complexation/agglomeration behavior and cellular attachment and adsorption. The applied methodology provides an efficient and feasible approach for evaluating potential accumulation and hazardous effects of nanoparticles to algae caused by particle interactions with the algae cell walls.

General information
Publication status: Published
Organisations: Department of Environmental Engineering, Environmental Chemistry, Technical University of Denmark, Wageningen University & Research, Dansk Fundamental Metrology A/S, Radboud University Nijmegen
Number of pages: 10
Pages: 11-20
Publication date: 2017
Peer-reviewed: Yes

Publication information
Journal: Aquatic Toxicology
Volume: 183
ISSN (Print): 0166-445X
Ratings:
BFI (2017): BFI-level 2
Scopus rating (2017): CiteScore 4.18 SJR 1.456 SNIP 1.233
Web of Science (2017): Impact factor 3.884
Web of Science (2017): Indexed yes
Original language: English
Keywords: Aquatic Science, Health, Toxicology and Mutagenesis, Bio-adsorption, Colloidal interaction, Nanoeotoxicity, Nanoplastics, Surface functionalization, algae, Chlorophyta
