Transformation and migration in secondary zinc-air batteries studied by in situ synchrotron X-ray diffraction and X-ray tomography

There are numerous challenges associated with developing secondary Zn-air batteries regarding e.g. power density and cycle life. Some of the challenges are related to morphological changes in the anode during cycling due to combined electrochemical and chemical processes involved in the reversible Zn – ZnO transformation. We present a unique in situ synchrotron X-ray diffraction study, where a combination of time and spatial resolution allows information about transformation and transport in a Zn/ZnO anode during discharge/charge operation. By tracking Zn and ZnO reflections during cycling of two Zn-air batteries we see that the conversion of these phases is accompanied by transport into the anode and the anode configuration does not return to its initial state after recharge due to ZnO migration to other parts of the battery. During charge Zn metal is deposited as microcrystalline material, changing the morphology and phase distribution in the anode. The XRD results were supported by qualitative in situ X-ray computed tomography that confirms depletion of ZnO and non-homogeneous distribution of Zn.

General information
Publication status: Published
Organisations: Electrochemical Materials, Department of Energy Conversion and Storage, Imaging and Structural Analysis, University of Copenhagen
Corresponding author: Norby, P.
Contributors: Christensen, M. K., Mathiesen, J. K., Simonsen, S. B., Norby, P.
Pages: 6459-6466
Publication date: 1 Jan 2019
Peer-reviewed: Yes

Publication information
Journal: Journal of Materials Chemistry A
Volume: 7
Issue number: 11
ISSN (Print): 2050-7488
Ratings:
BFI (2019): BFI-level 2
Web of Science (2019): Indexed yes
Original language: English
