Vibrant times for mechanical metamaterials - DTU Orbit (06/10/2019)

Vibrant times for mechanical metamaterials
Metamaterials are man-made designer matter that obtains its unusual effective properties by structure rather than chemistry. Building upon the success of electromagnetic and acoustic metamaterials, researchers working on mechanical metamaterials strive at obtaining extraordinary or extreme elasticity tensors and mass-density tensors to thereby mold static stress fields or the flow of longitudinal/transverse elastic vibrations in unprecedented ways. In this prospective paper, we focus on recent advances and remaining challenges in this emerging field. Examples are ultralight-weight, negative mass density, negative modulus, pentamode, anisotropic mass density, Origami, nonlinear, bistable, and reprogrammable mechanical metamaterials.

General information
Publication status: Published
Organisations: Department of Photonics Engineering, Structured Electromagnetic Materials, Karlsruhe Institute of Technology
Contributors: Christensen, J., Kadic, M., Kraft, O., Wegener, M.
Pages: 453-462
Publication date: 2015
Peer-reviewed: Yes

Publication information
Journal: M R S Communications
Volume: 5
Issue number: 3
ISSN (Print): 2159-6859
Ratings:
Scopus rating (2015): CiteScore 1.66 SJR 0.914 SNIP 0.603
Web of Science (2015): Impact factor 1.797
Web of Science (2015): Indexed yes
Original language: English
Electronic versions:
