Voltammetric study of one-step electrochemical methane production during water and CO2 co-electrolysis in molten CsH2PO4 - DTU Orbit (24/07/2019)

Voltammetric study of one-step electrochemical methane production during water and CO2 co-electrolysis in molten CsH2PO4

Cyclic voltammetry was performed with a nickel electrode in molten CsH2PO4 at 350°C and at approximately 25bar of water pressure. The effect of adding carbon dioxide was examined. It is found that even small amounts of CO2 (partial pressure below 0.2bar at 350°C, corresponding to 0.5bar at 22°C of a 5:1 mixture of N2:CO2) have a pronounced effect on the cyclic voltammetry curves. Under these conditions the hydrogen formation is substituted by another process, methane formation. At the same time the cathodic current increased by a factor of 4–6, meaning that the ease of methanisation was much improved.

General information
Publication status: Published
Organisations: Department of Energy Conversion and Storage, Electrochemistry, Department of Chemistry
Contributors: Nikiforov, A. V., Petrushina, I., Christensen, E., Berg, R. W., Bjerrum, N. J.
Number of pages: 6
Pages: 508-513
Publication date: 2020
Peer-reviewed: Yes

Publication information
Journal: Renewable Energy
Volume: 145
ISSN (Print): 0960-1481
Original language: English
Keywords: Co-electrolysis, Carbon dioxide, CsH2PO4, Methane, Voltammetry
DOIs:
10.1016/j.renene.2019.06.075
Research output: Contribution to journal › Journal article – Annual report year: 2020 › Research › peer-review
