Challenges for innovation in the maritime industry

Perunovic, Zoran; Fürstenberg, Sofia; Christoffersen, Mads

Publication date: 2014

CHALLENGES
for Innovation in Networks in the Maritime Industry

Zoran Perunovic, Technical University of Denmark
Sofia Furstenberg, AP Moller-Maersk
Mads Christoffersen, Technical University of Denmark
Innovation dynamics in the maritime industry

Perunovic and Vidic-Perunovic (2012)
Research sponsored by the Danish Maritime Fund

Research objectives

• Determine the **key enablers, barriers, and mechanisms** of “innovation in networks” in the maritime industry

• Identify the key **characteristics of collaborative innovation processes** applied in the maritime industry

• Determine **managerial actions** to be undertaken to organize for successful innovation in networks

• **Asses the benefits** of innovation in networks

Research strategy
• Multiple-case research strategy
Research design

Explanation of how “innovation in networks” creates value for participants in the maritime industry
Regulatory requirements

Air pollution reduction
SOx, NOx, PM, CO₂

Ballast Water Treatment
## Regulatory requirements

### SOx reduction

<table>
<thead>
<tr>
<th>Outside an ECA established to limit SOx and particulate matter emissions</th>
<th>Inside an ECA established to limit SOx and particulate matter emissions</th>
</tr>
</thead>
<tbody>
<tr>
<td>4.50% m/m prior to 1 January 2012</td>
<td>1.50% m/m prior to 1 July 2010</td>
</tr>
<tr>
<td>3.50% m/m on and after 1 January 2012</td>
<td>1.00% m/m on and after 1 July 2010</td>
</tr>
<tr>
<td>0.50% m/m on and after 1 January 2020*</td>
<td>0.10% m/m on and after 1 January 2015</td>
</tr>
</tbody>
</table>

* May be pushed to 2025. Decision in 2018 or earlier.
### Regulatory requirements

#### NOx reduction

<table>
<thead>
<tr>
<th>Tier</th>
<th>Ship construction date on or after</th>
<th>Total weighted cycle emission limit (g/kWh)</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
<td>( n = ) engine’s rated speed (rpm)</td>
</tr>
<tr>
<td></td>
<td></td>
<td>( n &lt; 130 )</td>
</tr>
<tr>
<td>I</td>
<td>1 January 2000</td>
<td>17.0</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>II</td>
<td>1 January 2011</td>
<td>14.4</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>III</td>
<td>1 January 2016</td>
<td>3.4</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Tier III enforcement date (January 2016) is being debated. US and Canada will implement 2016. Other and new ECA still uncertain.**

**Major engine conversion could shift compliance from Tier I to Tier II**
Regulatory requirements

Greenhouse gasses

**IMO postponed - US will start**

**Different requirements for approval of systems**

50+ different systems
Technologies

SOx reduction

SOx reduction measures and technologies

- Low sulfur fuels
  - Liquefied Natural Gas
  - Distillate fuel
    - Marine Diesel Oil
    - Marine Gas Oil
  - Biofuels
  - Fuel blends
- Scrubber
  - Wet
  - Closed loop
  - Hybrid
  - Dry

Engine modifications required

Lengthy installation process

LNG not effective for retrofitting
Technologies
NOx reduction

**Tier II**
Primary control (at engine)
- Engine design and operational adjustment of parameters and components
  - Fuel injection
  - Valve timing
  - Charge air
  - Compression ratio
- Reduction of temperature and oxygen content
  - Water-in-fuel
  - Fuel water emulsion
  - Direct water injection
  - Humid air motor
  - Scavenging air moistening

**Tier III**
Post-combustion abatement
- Selective catalytic reduction
- Exhaust gas recirculation
  - Four-stroke medium speed engine
  - Two-stroke low speed engine

**Negative correlation between fuel combustion efficiency and NOx emission**
Technologies
Energy efficiency and CO2 reduction

Energy efficiency and CO2 reduction technologies

**Operational measures**
- Improved voyage planning
- Propeller cleaning
- Slow steaming

**Market based measures**
- Contribution schemes for CO2 emissions from international shipping
- Emission trading systems
- Schemes based on actual efficiency

**Technical measures**
- Reduction in ship resistance
  - Optimized hull design
  - Advanced hull coatings
  - Lightweight materials
  - Speed reduction
- Improved efficiency of main and auxiliary engines
  - De-rated engines
  - Efficient engines
  - Contra-rotating propulsion
  - Improved auxiliary machinery
  - Different devices for improving propulsion efficiency
  - Low carbon fuels (LNG and biodiesel)
- Improved power management (increase in power production efficiency and reduction in auxiliary power consumption)
  - Waste heat recovery system
  - Shaft propulsion generators
  - Electrical energy efficient technologies
  - Improved transmission systems
  - Wind, solar, and nuclear energy
  - Hybrid power systems

**Retrofit vs Newbuild**

Ballast water treatment

Ballast Water Management (BWM)

Recording procedures
- BW Management Plan
- BW Record Book

BWM Methods
- BW Exchange
  - Sequential
  - Flow through
  - Dilution

- BW Treatment
  - Mechanical
  - Physical
  - Chemical
    - Filtration
    - Magnetic separation
    - Hydrocyclone
    - Thermal (heat)
    - Ultraviolet irradiation
    - Ultrasound
    - Cavitation
    - Inert Gas Deoxygenation

- Sediment management

- BW Isolation
  - Reception facilities
  - Return to origin

Training and education
Market challenges

- Fleet over-capacity creates low freight rates and aggressive competition
- Price development of HFO vs. other fuel options such as LNG, is very difficult to predict, and the outcome will have tremendous effect on the business case for the different options
- Market is growing North-South rather than East-West, with different trade of goods, and thus different types of ships. Hence, obsolete vessels on e.g. Asia-Europe trade cannot easily be transferred to Europe-South America
- Ships being built today have an expected life-time of 25 years. Regulatory landscape will look different by then, but many solutions are irreversible – hence placing the bet on LNG is not something you can go and change
In general

Stakeholders are not used to innovation dynamics created by deployment of goal-based policies
Reactive behavior on innovation
Innovation paradigms
Conflicting interest of different stakeholders

Enforcement dates
Lack of compliance control
Variation in different regions and countries

Oversaturated market
Fuel cost and availability
Route dependency

Low technology readiness
Myriad of unproven technologies and suppliers
Retrofit or new build
Innovation networks

- Owner driven
- Vertical engine maker-driven
- Horizontal engine maker-driven
- Participant driven informal
- Open networks (government driven)
- Classification society driven decentralized networks
Formation

Discontinuous Innovation High tech industries

Owner driven

Incremental innovation

DTU Business Executive School of Business
Key enablers

Good network management
Absorptive capacity

Key barriers

Social capital mind set
Lack of innovation stimulating organizational culture
Use of innovative products and solutions in operations

Opportunity

Structural holes between technology suppliers
Horizontal networks among owners and technology suppliers
